Aircraft Flight Manual

Doc. No. 2006/044 4th Edition – Rev. 20 March 13, 2023

TECNAM P2006T

MANUFACTURER: COSTRUZIONI AERONAUTICHE TECNAM S.p.A.

AIRCRAFT MODEL: **P2006T**

EASA Type Certificate No: A.185 (DATED 2009, JUNE 5TH)

SERIAL NUMBER:

BUILD YEAR:

REGISTRATION MARKINGS:

This Aircraft Flight Manual is approved by European Aviation Safety Agency (EASA).

This Manual contains information required by the FAA to be furnished to the pilot for operation in the U.S.A. plus information supplied by the manufacturer. It is approved by EASA on behalf of the FAA per FAR 21.29.

This Manual must be carried in the airplane at all times.

The airplane has to be operated in compliance with procedures and limitations contained herein.

2.	LIST OF EFFECTIVE PAGES	7
3.	FOREWORD	10
4	SECTIONS LIST	11

1. RECORD OF REVISIONS

Any revision to the present Manual, except actual weighing data, is recorded: a Record of Revisions is provided at the front of this manual and the operator is advised to make sure that the record is kept up-to-date.

The Manual issue is identified by Edition and Revision codes reported on each page, lower right side.

The revision code is numerical and consists of the number "0"; subsequent revisions are identified by the change of the code from "0" to "1" for the first revision to the basic publication, "2" for the second one, etc.

Should be necessary to completely reissue a publication for contents and format changes, the Edition code will change to the next number ("2" for the second edition, "3" for the third edition etc).

Additions, deletions and revisions to existing text will be identified by a revision bar (black line) in the left-hand margin of the page, adjacent to the change.

When technical changes cause expansion or deletion of text which results in unchanged text appearing on a different page, a revision bar will be placed in the right-hand margin adjacent to the page number of all affected pages providing no other revision bar appears on the page.

These pages will be updated to the current regular revision date.

NOTE: It is the responsibility of the owner to maintain this handbook in a current status when it is being used for operational purposes.

2. LIST OF EFFECTIVE PAGES

The List of Effective Pages (LOEP), applicable to manuals of every operator, lists all the basic AFM pages: each manual could contain either basic pages or one variant of these pages when the pages of some Supplements are embodied.

Should the Supplements be embodied in accordance with approved instructions, make reference to the LOEP addressed on the Supplements themselves.

3. FOREWORD

Tecnam **P2006T** is a twin-engine four-seat aircraft with high cantilevered wing and tricycle retractable landing gear.

Section 1 supplies general information and it contains definitions, symbols explanations, acronyms and terminology used.

Before using the airplane, you are recommended to read carefully this manual: a deep knowledge of airplane features and limitations will allow you for operating the airplane safely.

For further information, please contact:

1. INTRODUCTION

The Aircraft Flight Manual has been implemented to provide the owners with information for a safe and efficient use of the aircraft TECNAM P2006T.

Warning - Caution - Note

Following definitions apply to warnings, cautions and notes used in the Aircraft Flight Manual.

The non-observation of the corresponding procedure can lead, as immediate effect, to a significant reduction of the flight safety.

The non-observation of the corresponding procedure can lead to an equipment damage which leads to a reduction of the flight safety in a short or longer time interval.

Draws the attention to a procedure not directly related to safety of flight.

2. THREE-VIEW AND DIMENSIONS

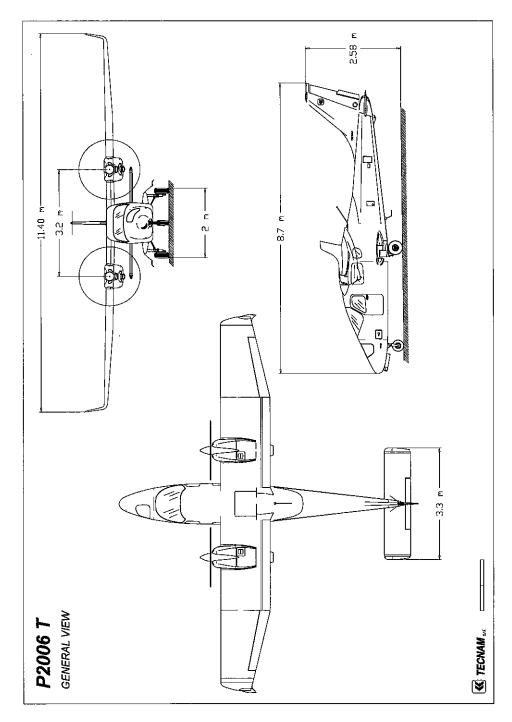

Figure 1 - General views

Dimensions

Overall	dimensions

Wingspan 11,4 m 37,4 ft Length 8,7 m 28,5 ft Overall height 2,58 m 8,46 ft

Wing

 $14,76 \text{ m}^2$ 158,9 ft² Wing surface Mean Geometric Chord 1,295 m 4,25 ft

1° Dihedral Aspect ratio 8,80

Main Landing Gear

Track 2.0 m Wheelbase 2.9 m Tire 6.00-6

Wheel rim assembly (Cleveland) P/N 40-59A

Nose Landing Gear

Tire 5.00 - 5

Wheel rim assembly (Cleveland) P/N 40-77C

3. CONTROL SURFACES TRAVEL LIMITS

Ailerons Up 20° Down 17 ° $(\pm 2^\circ)$

Stabilator (refer to Trailing Edge) Up 15° Down 4° (± 2°)

Rudder RH 26° LH 26° (± 2°)

Rudder trim tab RH 20° LH 20° (± 2°)

Flaps $0^{\circ}; 40^{\circ} (-2^{\circ})$

4. ENGINE

Manufacturer Bombardier-Rotax GmbH

Model 912 S3

Certification basis FAR 33 - Amendment 15

Type Certificate EASA TCDS no. E.121 dated 1 April

2008

Engine type 4 cylinders horizontally opposed with

1352 c.c. of overall displacement, liquid cooled cylinder heads, ram-air cooled cylinders, two carburetors, integrated reduction gear box with torsional shock ab-

sorber and overload clutch.

Maximum power (at declared rpm) 73.5 kW (98.6hp) @ 5800 rpm -5

minutes maximum.

69.0 kW (92.5hp) @ 5500 rpm (continu-

ous)

5. PROPELLER

Manufacturer MT Propeller

Type Certificate LBA 32.130/086 (MTV-21 series)

Model MTV-21-A-C-F/CF178-05

Blades/hub 2 wood/composite blades – aluminum

hub

Diameter 1780 mm (no reduction allowed)

Type Variable pitch - hydraulically controlled

GOVERNOR

Manufacturer

Mt Propeller

Model

P-875-12

Type

Hydraulic

FUEL

Approved fuel:

MOGAS ASTM D4814

MOGAS EN 228 Super/Super plus

(min. RON 95)

AVGAS 100LL (ASTM D910)

(see also Section 2)

Fuel tanks

Two integrated tanks (one in each

wing) fitted with drainable sump

and drain valve

Capacity of each wing tan

100 litres (26,42 US gallons)

Tanks overall capacity

200 litres (52,8 US gallons)

Overall usable fuel

194.4 litres (51,35 US gallons)

Overall unusable fuel

5.6 litres (1,48 US gallons)

LUBRICATION

Lubrication system

Forced type with external reservoir

Oil

Use only oil with API classification "SG"

or higher. For additional info, refer to "Rotax Operators Manual" - last issue -, "Op-

erating Media" Section.

Oil capacity

Max. 3.0 litres - min. 2.0 litres (per

tank) (*)

(*): In accordance with SB-912-04 R1 the minimum oil level is recommended to 2.50 liters.

9. COOLING

Cooling system

Ram-air cooled cylinders, liquid

cooled cylinder heads (closed and

pressurized circuit)

Coolant liquid

Certified for Water/Coolant mixture.

Make reference to "Rotax Operators

Manual" - last issue

Overall circuit capacity

 1410 cm^3

10. WEIGHTS

See Section 2.

11. STANDARD WEIGHTS

Empty Weight: see weighing record on Section 6

12. SPECIFIC LOADINGS

	MTOW 1180 kg (2601 lb)	MTOW 1230 kg (2712 lb)
Wing Loading	80 kg/m ² (16,37 lb/sqft)	83 kg/m ² (17,1 lb/sqft)
Power Loading	6.0 kg/hp (13,26 lb/hp)	6.28 kg/hp (13,84 lb/hp)

NOTE. Reference is made to both MTOW: 1180 kg and 1230 kg (if Supplement A19 or G10 - Increased MTOW @1230 KG - is applicable).

Section 1 - General

GENERAL FEATURES

4th Edition, Rev 0

13. ACRONYMS AND TERMINOLOGY

TT C 1 C	
KCAS	<u>Calibrated Airspeed</u> is the indicated airspeed expressed in knots, corrected taking into account the errors related to the instrument itself and its installation.
KIAS	<u>Indicated Airspeed</u> is the speed shown on the airspeed indicator and it is expressed in knots.
KTAS	<u>True Airspeed</u> is the KCAS airspeed corrected taking into account altitude and temperature.
V_A	<u>Design Manoeuvring speed</u> is the speed above the which it is not allowed to make full or abrupt control movement.
$V_{ ext{FE}}$	<u>Maximum Flap Extended speed</u> is the highest speed permissible with flaps extended.
V_{LO}	<u>Maximum Landing Gear Operating speed</u> is the maximum speed allowed to retract or to extend the landing gear.
V_{LE}	<u>Maximum Landing Gear Extended speed</u> is the maximum speed allowed with the landing gear extended.
V _{MC}	<u>Minimum control speed</u> : is the minimum speed necessary to ensure an efficient aircraft control in case of one engine inoperative.
V_{NO}	<u>Maximum Structural Cruising Speed</u> is the speed that should not be exceeded, except in smooth air and only with caution.
V_{NE}	Never Exceed Speed is the speed limit that may not be exceeded at any time.
Vo	Operating Manoeuvring speed is the speed above the which it is not allowed to make full or abrupt control movement
V_S	Stall Speed.
V_{80}	<u>Stall Speed in landing configuration</u> (flaps and landing gear extended).
V_{S1}	Stall speed in the given flap and landing gear configuration.
V_{SSE}	Recommended safe simulated OEI speed is the minimum speed at which simulated OEI training operation should be executed.
V_X	Best Angle-of-Climb Speed is the speed which allows best ramp climb performances.
\mathbf{V}_{Y}	Best Rate-of-Climb Speed is the speed which allows the best gain in altitude over a given time.
V_R	<u>Rotation speed</u> : is the speed at which the aircraft rotates about the pitch axis during takeoff
$ m V_{YSE}$	Best Rate-of-Climb speed in case of one engine inoperative.

Meteorological terminology

ISA	International Standard Atmosphere: is the air atmospheric standard condition at sea level, at 15°C (59°F) and at 1013.25hPa (29.92inHg).
QFE"	Official atmospheric pressure at airport level: it indicates the aircraft absolute altitude with respect to the official airport level.
QNH	<u>Theoretical atmospheric pressure at sea level:</u> is the atmospheric pressure reported at the medium sea level, through the standard air pressure-altitude relationship, starting from the airport QFE.
OAT	<u>Outside Air Temperature</u> is the air static temperature expressed in degrees Celsius (°C).
T_S	Standard Temperature is 15°C at sea level pressure altitude and decreased by 2°C for each 1000 ft of altitude.
H _P	<u>Pressure Altitude</u> is the altitude read from an altimeter when the barometric subscale has been set to 1013 mb.

Aircraft performance and flight planning terminology

Crosswiria velocity is the velocity of the crosswing compe	Crosswind Velocity	is the velocity of the crosswind compo
--	--------------------	--

for the which adequate control of the airplane during takeoff and landing is assured.

Usable fuel is the fuel available for flight planning.

Unusable fuel is the quantity of fuel that cannot be safely

used in flight.

G is the acceleration of gravity.

TOR is the takeoff distance measured from actual

start to wheel liftoff point.

TOD is total takeoff distance measured from start

to 15m obstacle clearing.

GR is the distance measured during landing

from actual touchdown to stop point.

LD is the distance measured during landing,

from 15m obstacle clearing to actual stop.

S/R is the specific range, that is the distance (in

nautical miles) which can be expected at a specific power setting and/or flight configu-

ration per kilogram of fuel used.

Weight and balance terminology

Datum "Reference datum" is an imaginary vertical

plane from which all horizontal distances are

measured for balance purposes.

Arm is the horizontal distance of an item meas-

ured from the reference datum.

Moment is the product of the weight of an item mul-

tiplied by its arm.

C.G. <u>Center of Gravity</u> is the point at which the

airplane, or equipment, would balance if suspended. Its distance from the reference datum is found by dividing the total moment

by the total weight of the aircraft.

Standard Empty Weight is the weight of the aircraft with engine flu-

ids and oil at operating levels.

Basic Empty Weight is the standard empty weight to which it is

added the optional equipment weight.

Useful Load is the difference between maximum takeoff

weight and the basic empty weight.

Maximum Takeoff Weight is the maximum weight approved to perform

the takeoff.

Maximum Landing Weight is the maximum weight approved for the

landing touchdown (for P2006T it is equiv-

alent to the Maximum Takeoff Weight).

1. INTRODUCTION

Section 2 includes operating limitations, instrument markings and basic placards necessary for safe operation of **P2006T** aircraft, its engines and standard systems and equipment.

This AFM Section is EASA approved.

P2006T - Aircraft Flight Manual

2 SPEED LIMITATIONS

The following table addresses the airspeed limitations and their operational significance:

SPEED		KIAS	KCAS	REMARKS	
v _{NE}	Never exceed speed		171	172	Do not exceed this speed in any operation.
V _{NO}	Maximum Structural Cruising Speed		138	136	Do not exceed this speed except in smooth air, and only with caution.
V _A	Design Manoeuvring speed		122	119	Do not make full or abrupt control movement above
v _o	Operating Manoeuvring speed				this speed, because under certain conditions the air-craft may be overstressed by full control movement.
$V_{ m LE}$	Maximum Landing Gear extended speed		93	93	Do not exceed this speed with the landing gear extended.
v _{LO}	Maximum Landing Gear operating speed		93	93	Do not exceed this speed when operating the landing gear.
V_{FE}	Maximum flaps		93	93	Do not exceed this speed for indicated flaps setting.
	extended speed	T.O.	122	119	
V _{MC}	Aircraft minimum control speed with one engine inoperative		62	62	Do not reduce speed below this value in event of one engine inoperative condi- tion.

3 AIRSPEED INDICATOR MARKINGS

Airspeed indicator markings and their colour code are explained in the following table.

MARKING	KIAS	EXPLANATION
White arc	54-93	Lower limit is V _{SO} , upper limit is the maximum allowable speed with flaps extended in <i>FULL</i> position.
Red line	62	Minimum aircraft control speed with one engine inoperative and flaps set to T.O.
Green arc	66-138	Normal aircraft operating range (lower limit is Vs1, stall speed in "clean" configuration, and upper limit is the maximum structural cruise speed V _{NO}).
Blue line	84	Best rate-of-climb speed with one engine in- operative at sea level.
Yellow arc	138-171	Speed range where manoeuvres must be conducted with caution and only in smooth air.
Red line	171	Maximum speed for all operations.

POWERPLANT LIMITATIONS

Following table reports the operating limitations for both engines installed:

ENGINE MANUFACTURER: Bombardier Rotax GmbH.

ENGINE MODEL: 912 S3

MAXIMUM POWER:

	Max Power kW (hp)	Max rpm. Prop. rpm (engine)	Time max. (minutes)
Max. T.O.	73.5 (98.6)	2388 (5800)	5
Max. Cont.	69 (92.5)	2265 (5500)	-

Temperatures:

Max CHT*

135° C

Max CT

120° C

Min/Max Oil

50° C / 130° C

Oil normal operating range (approx.)

90° C / 110° C

Oil Pressure:

Minimum

0.8 Bar / 12psi

(below 1400 rpm prop)

Normal

2 - 5 Bar / 29-73psi

(above 1400 rpm prop)

Maximum

7 Bar / 102 psi

(above 1400 rpm prop)

Engine starting: allowable temperature range

OAT Min

-25° C

OAT Max

+50° C

In event of cold starting operation, it is permitted a maximum oil pressure of 7 bar for a short period.

EASA Approved

4th Edition, Rev. 0

applicable for Engines up to serial no. 4924543(included) and repaired engine which doesn't change the cylinder head n°3 with new one (part no. 413195)

9. COOLING

Cooling system

Ram-air cooled cylinders, liquid

cooled cylinder heads (closed and

pressurized circuit)

Coolant liquid

Certified for Water/Coolant mixture.

Make reference to "Rotax Operators

Manual" - last issue

Overall circuit capacity

 1410 cm^3

10. WEIGHTS

See Section 2.

11. STANDARD WEIGHTS

Empty Weight: see weighing record on Section 6

12. SPECIFIC LOADINGS

	MTOW 1180 kg (2601 lb)	MTOW 1230 kg (2712 lb)
Wing Loading	80 kg/m ² (16,37 lb/sqft)	83 kg/m ² (17,1 lb/sqft)
Power Loading	6.0 kg/hp (13,26 lb/hp)	6.28 kg/hp (13,84 lb/hp)

NOTE. Reference is made to both MTOW: 1180 kg and 1230 kg (if Supplement A19 or G10 - Increased MTOW @1230 KG - is applicable).

13. ACRONYMS AND TERMINOLOGY

KCAS	<u>Calibrated Airspeed</u> is the indicated airspeed expressed in knots, corrected taking into account the errors related to the instrument itself and its installation.
KIAS	<u>Indicated Airspeed</u> is the speed shown on the airspeed indicator and it is expressed in knots.
KTAS	<u>True Airspeed</u> is the KCAS airspeed corrected taking into account altitude and temperature.
V_A	<u>Design Manoeuvring speed</u> is the speed above the which it is not allowed to make full or abrupt control movement.
$ m V_{FE}$	<u>Maximum Flap Extended speed</u> is the highest speed permissible with flaps extended.
$ m V_{LO}$	<u>Maximum Landing Gear Operating speed</u> is the maximum speed allowed to retract or to extend the landing gear.
$V_{ t LE}$	Maximum Landing Gear Extended speed is the maximum speed allowed with the landing gear extended.
$ m V_{MC}$	<u>Minimum control speed</u> : is the minimum speed necessary to ensure an efficient aircraft control in case of one engine inoperative.
V_{NO}	<u>Maximum Structural Cruising Speed</u> is the speed that should not be exceeded, except in smooth air and only with caution.
$V_{ ext{NE}}$	<u>Never Exceed Speed</u> is the speed limit that may not be exceeded at any time.
\mathbf{v}_{o}	Operating Manoeuvring speed is the speed above the which it is not allowed to make full or abrupt control movement
V_S	Stall Speed.
V_{S0}	<u>Stall Speed in landing configuration</u> (flaps and landing gear extended).
V_{S1}	Stall speed in the given flap and landing gear configuration.
V_{SSE}	<u>Recommended safe simulated OEI speed</u> is the minimum speed at which simulated OEI training operation should be executed.
V_X	<u>Best Angle-of-Climb Speed</u> is the speed which allows best ramp climb performances.
V_{Y}	Best Rate-of-Climb Speed is the speed which allows the best gain in altitude over a given time.
V_R	Rotation speed: is the speed at which the aircraft rotates about the pitch axis during takeoff
$V_{\mathtt{YSE}}$	Best Rate-of-Climb speed in case of one engine inoperative.

Aircraft performance and flight planning terminology

Crosswiria velocity is the velocity of the crosswing compe	Crosswind Velocity	is the velocity of the crosswind compo
--	--------------------	--

for the which adequate control of the airplane during takeoff and landing is assured.

Usable fuel is the fuel available for flight planning.

Unusable fuel is the quantity of fuel that cannot be safely

used in flight.

G is the acceleration of gravity.

TOR is the takeoff distance measured from actual

start to wheel liftoff point.

TOD is total takeoff distance measured from start

to 15m obstacle clearing.

GR is the distance measured during landing

from actual touchdown to stop point.

LD is the distance measured during landing,

from 15m obstacle clearing to actual stop.

S/R is the specific range, that is the distance (in

nautical miles) which can be expected at a specific power setting and/or flight configu-

ration per kilogram of fuel used.

Fuel pressure:

Minimum

2.2 psi (0.15 Bar)

Maximum

5.8 psi (0.40 Bar) or 7.26 psi* (0.5 Bar)

*only applicable for fuel pump part no. 893110,893114 or 893115.

5. LUBRICANT

Use only oil with API classification "SG" or higher.

For additional info, refer to "Rotax Operators Manual" - last issue -, "Operating Media" Section.

6. **COOLANT LIQUID**

Refer to "Rotax Operators Manual" – last issue -, "Operating Media" Section.

7. PROPELLER

MANUFACTURER:

MT Propeller

MODEL:

MTV-21-A-C-F-/CF178-05

TYPE:

wood/composite 2-blade, variable pitch hydraulically con-

trolled and fully featherable

DIAMETER:

1780 mm (no reduction is permitted)

8. **GOVERNOR**

MANUFACTURER:

MT Propeller

MODEL:

P-875-12

OPERATION:

Hydraulically controlled (oil pressure to reduce the

pitch)

Fuel pressure:

Minimum

2.2 psi (0.15 Bar)

Maximum

5.8 psi (0.40 Bar) or 7.26 psi* (0.5 Bar)

*only applicable for fuel pump part no. 893110,893114 or 893115.

5. LUBRICANT

Use only oil with API classification "SG" or higher.

For additional info, refer to "Rotax Operators Manual" - last issue -, "Operating Media" Section.

6. **COOLANT LIQUID**

Refer to "Rotax Operators Manual" – last issue -, "Operating Media" Section.

7. PROPELLER

MANUFACTURER:

MT Propeller

MODEL:

MTV-21-A-C-F-/CF178-05

TYPE:

wood/composite 2-blade, variable pitch hydraulically con-

trolled and fully featherable

DIAMETER:

1780 mm (no reduction is permitted)

8. **GOVERNOR**

MANUFACTURER:

MT Propeller

MODEL:

P-875-12

OPERATION:

Hydraulically controlled (oil pressure to reduce the

pitch)

9. **MAXIMUM OPERATING ALTITUDE**

Maximum operating altitude is 14000 ft (4260 m) MSL.

Flight crew is required to use supplemental oxygen according to applicable Air Operation Rules.

10. AMBIENT TEMPERATURE

Ambient temperature: from -25°C to +50°C.

Flight in expected and/or known icing conditions is forbidden.

11. POWERPLANT INSTRUMENTS MARKINGS

Powerplant instrument markings and their colour code significance are shown below:

Instrum	1ENT	RED LINE Minimum Iimit	GREEN ARC Normal operating	YELLOW ARC Caution	RED LINE Maximum limit
Propeller	rpm		580 - 2265	2265 - 2388	2388
Oil temp.	°C	50	90 – 110	50 – 90 110-130	130
			50 – 130 ⁽¹⁾	(2)	
CT	°C		50 – 120		120
CHT ⁽³⁾	°C		50 – 135		135
Oil pressure	bar	0.8	2 - 5	0.8 - 2 5 - 7 ⁽⁴⁾	7
Fuel press.	psi	2.2	2.2 - 5.8 or 7.2 ⁽⁵⁾		5.8 or 7.2 ⁽³⁾
Fuel Q.ty	litres	0 ⁽⁶⁾	Li 44 M A		

12. OTHER INSTRUMENTS MARKINGS

INSTRUMENT	RED LINE Minimum limit	GREEN ARC Normal operating	YELLOW ARC Caution	RED LINE Maximum limit
Voltmeter	10,5 Volt	12 - 14 Volt		

If MOD2006/212 is embodied, markings are unchanged so refer to the basic AFM for information.

4th Edition, Rev. 15

¹ Applicable for aircraft with MOD2006/280 embodied.

² Applicable for aircraft with MOD2006/280 embodied.

³ Applicable for Engines up to serial no. 4924543(included) and repaired engine which doesn't change the cylinder head n°3 with new one (part no. 413195).

⁴ In event of cold starting operation, it is permitted a maximum oil pressure of 7 bar for a short period.

⁵ Only applicable for fuel pump part no. 893110,893114 or 893115.

^{6 &}quot;0" indication shows the unusable fuel quantity (2,8 litres for each fuel tank).

13. WARNINGS, CAUTIONS AND ADVISORIES LIGHTS

Following table addresses the warning, caution and advisory lights installed (unless differently specified) on the annunciator panel:

Warnings (RED)	Cause	
LH OVERVOLT	LH electric system overvoltage	
RH OVERVOLT	RH electric system overvoltage	
MAIN DOOR OPEN ALERT	Main door open and/or unlocked	
REAR DOOR OPEN ALERT	Rear door open and/or unlocked	
LH LOW COOLANT	Left engine - coolant liquid low level	
RH LOW COOLANT	Right engine - coolant liquid low level	
LH ENGINE FIRE	Left engine compartment: fire detected	
RH ENGINE FIRE	Right engine compartment: fire detected	
LG TRANSITION (warning light installed near the landing gear control lever)	One or more legs are in transition phase and/o the selected retracted/extended position is not you reached.	
Cautions (Amber) Cause		
LH GENERATOR	LH generator failure	
RH GENERATOR	RH generator failure	
EXT POWER	External electrical supply connected	
PITOT HEAT	Pitot heating system failure/not activated	
GEAR PUMP ON	LG pump electrically supplied	
Advisories (Green)	Indication	
LH FUEL PUMP	Left engine - electrical fuel pump ON	
RH FUEL PUMP	Right engine - electrical fuel pump ON	
PITOT HEAT	Pitot heating system ON	
LG Down & Locked (3 advisory lights, one for each leg, installed near the landing gear control lever)	Landing gear extended and locked	

EASA Approved

4th Edition, Rev. 0

P2006T - Aircraft Flight Manual

Page W2-15

14 WEIGHTS

Condition	Weig	ht
Maximum takeoff weight	1230 kg	2712 lb
Maximum landing weight	1230 kg	2712 lb
Maximum zero wing fuel weight	1195 kg	2635 lb

Refer to Para. 21.4 of this AFM Section for baggage loading limitations.

15. CENTER OF GRAVITY RANGE

Datum

Vertical plane tangent to the wing leading edge (the aircraft

must be levelled in the longitudinal plane)

Levelling

Refer to the seat track supporting beams (see procedure in

Section 6)

Forward limit

0.221 m (16.5% MAC) aft of datum for all weights

Aft limit

0.415 m (31% MAC) aft of datum for all weights

The pilot is responsible for ensuring that the airplane is properly loaded. Refer to Section 6 for appropriate instructions

16. APPROVED MANEUVERS

The aircraft is certified in normal category in accordance with EASA CS-23 regula-

Non aerobatic operations include:

- · Any manoeuvre pertaining to "normal" flight
- Stalls (except whip stalls)
- Lazy eights
- Turns in which the angle of bank is not more than 60°
- Chandelle

Acrobatic manoeuvres, including spins and turns with angle of bank of more than 60°, are not approved for such a category. In addition, stall with one engine inoperative is forbidden.

Limit load factor could be exceeded by moving flight controls to maximum deflection at a speed above $V_A=V_O$ (118 KIAS, Manoeuvring Speed).

17. MANEUVERS LOAD FACTOR LIMITS

Maneuver load factors limits are as follows:

Positive

Negative

+3.8 g

- 1.78 g

Maneuver load factors limits with flaps extended are as follows:

Positive

Negative

+2g

0 g

18. FLIGHT CREW

Minimum crew:

Maximum number of occupants:

4 people (including the pilot)

EASA Approved

4th Edition, Rev. 0

19. FLIGHT CONDITIONS

The aircraft can be equipped for following flight operations (make reference to Para. 22 concerning the equipment list required on board to allow them):

VFR

Day and Night

IFR

Day and Night including IMC

Flight in expected and/or known icing conditions, in proximity of storms or severe turbulence is forbidden.

Additional equipment can be required to fulfil national or specific operational requirements. The owner is responsible for fulfilling these requirements.

Equipment list is addressed in Section 6.

20. FUEL

2 TANKS:

100 litres each one (26,42 US gallons)

MAXIMUM CAPACITY:

200 litres (52,8 US gallons)

MAXIMUM USABLE FUEL:

194.4 litres (51,35 US gallons)

APPROVED FUEL:

MOGAS ASTM D4814

MOGAS EN 228 Super/Super plus (min. RON 95)

AVGAS 100 LL (ASTM D910)

Prolonged use of Aviation Fuel Avgas 100LL results in greater wear of valve seats and greater combustion deposits inside cylinders due to higher lead content. It is therefore suggested to avoid using this type of fuel unless strictly necessary. Make reference to Rotax Maintenance Manual which prescribes dedicated checks due to the prolonged use of Avgas.

21. LIMITATIONS PLACARDS

Hereinafter the placards, related to the operating limitations and installed on P2006T, are reported.

21.1 SPEED LIMITATIONS

On the left side instrument panel, above on the left, it is placed the following placard reporting the speed limitations:

Manouvering speed

 $V_0 = 122 \text{ KIAS}$

Maximum L.G. op. speed

 $V_{LO}/V_{LE} = 93 \text{ KIAS}$

Speed limitations placard for MTOW @1230 kg (2712 lb)

21.2 OPERATING LIMITATIONS

On the instrument panel, it is placed the following placard reminding the observance of aircraft operating limitations; make reference to Para. 22 for the list of equipment required on board to allow flight operations in VFR Day, VFR Night, IFR Day and IFR Night conditions.

This A/C can be operated only in normal category DAY-NIGHT-VFR-IFR (with required equipment) in non-icing conditions. All aerobatics manoeuvres including spinning are prohibited. For operational limitations refer to FLIGHT MANUAL

EASA Approved

21.3. INFLIGHT ENGINE RESTART

The inflight engine restart procedure is reported on a placard (shown below) installed on the central console.

INFLIGHT ENGINE RESTART

1) Fuel Pump ON & normal engine starting

21.4. BAGGAGE COMPARTMENT CAPACITY

The placard shown below, and installed on the baggage compartment (vertical panel), concerns the baggage compartment load limitations herein reported:

- Maximum allowable load: 80kg/176lb
- Maximum intensity of loading: 0.9 kg/dm² 19 lbs/sqft

80kg/176lb MAX. SPEC. PRESS.

0.9 kg/dm² - 19 lbs/sqft

FASTEN THE BAGGAGES WITH CARGO NET BEFORE FLIGHT

EASA Approved

21.5. ENGINE OIL LEVEL

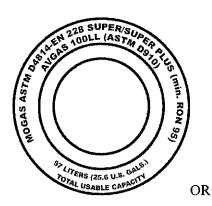

On the engine nacelle, in correspondence of the engine oil reservoir access door, it is located the following placard addressing the limitations concerning the oil level, the oil volume and the oil type.

USE ONLY OIL WITH API CLASSIFICATION SG OR HIGHER

21.6. FUEL TYPE

In correspondence of each fuel tank filler cap, it is located the following placard reporting the approved fuel type and the tank usable fuel.

MOGAS ASTM D4814-EN 228 SUPER/SUPER PLUS (min. RON 95) AVGAS 100LL (ASTM D910)

97 LITERS (25.6 U.S. GALS.) TOTAL USABLE CAPACITY

21.7. LANDING GEAR HYDRAULIC SYSTEM

The placard shown below, and located on the tail cone, concerns the allowed low pressure limit for the landing gear emergency accumulator.

The low pressure limit is 20 bar.

If during pre-flight inspection the value is below 20 bar, the system must be recharged by means of the override button (see Section 7, Para. 9).

WASENCY OIL TANA PRESS

LOW PRESSURE LIMIT **20 BAR**

21.8. REAR SEATS

During Taxi, Take OFF, Landing (including Emergency Landing), both rear seats must be kept in the lowest and full aft position.

The following placard is located aside both rear seats.

Rear seats must be kept in lowest and full aft position during Taxi, Take Off, Landing and Emergency Landing

21.9. OTHER PLACARDS

Description	Placard	Place

22. KINDS OF OPERATIONS EQUIPMENT LIST

This paragraph reports the KOEL table, concerning the equipment list required on board under CS-23 regulations to allow flight operations in VFR Day, VFR Night, IFR Day and IFR Night conditions.

Flight in VFR Day and Night, IFR Day and Night is permitted only if the prescribed equipment is installed and operational.

Additional equipment, or a different equipment list, for the intended operation may be required by national operational requirements and also depends on the airspace classification and route to be flown.

1. INTRODUCTION

Section 3 includes checklists and detailed procedures for coping with various types of emergency conditions that could arise after a system failure.

Before operating the aircraft, the pilot should become thoroughly familiar with this manual and, in particular, with this Section. Further on a continued and appropriate training and self-study should be done.

Emergency procedures associated with those optional systems and equipment which require handbook supplements are provided in separate Supplements.

Two types of emergency procedures are hereby given.

a. "BOLD FACES" which must be known by heart by the pilot and executed, in the correct and complete sequence, immediately after the failure is detected and confirmed.

These procedures characters are boxed and highlighted:

1.1. ENGINE FAILURE DURING TAKEOFF RUN

1. Throttle Lever BOTH IDLE 2. Rudder Keep heading control 3. -4. --

b. "other procedures" which should be well theoretically known and mastered, but that can be executed entering and following step by step the AFM current section appropriate checklist.

In any case, as a failure or abnormal behaviour is detected pilots should act as follows:

- 1. Keep self-control and maintain aircraft flight attitude and parameters
- 2. Analyse the situation identifying, if required, the area for a possible emergency landing
- 3. Apply the pertinent procedure
- 4. Inform the Air Traffic Control as applicable

For the safe conduct of later flights, any anomaly and/or failure must be communicated to the National Authorities in charge, in order to put the aircraft in a fully operational and safe condition.

In this Chapter, following definitions apply:

Land as soon as possible: land without delay at the nearest suitable area at which a safe approach and landing is assured.

Land as soon as practical: land at the nearest approved landing area where suitable repairs can be made.

2. **AIRPLANE ALERTS**

The annunciator panel, located on the left side instrument panel, contains 16 lights for warnings, cautions and advisories. The colours are as follows:

GREEN:

to indicate that pertinent device is turned ON

AMBER:

to indicate no-hazard situations which have to be considered and

which require a proper crew action

RED:

to indicate emergency conditions

2.1. SINGLE GENERATOR FAILURE / OVERVOLTAGE

189	RH	MAIN DOOR	PITOT	LH FUEL	RH FUEL	LH ENGINE	RH ENGINE
1439-1447	Generator	Open Alert	Heat	PUMP	PUMP	Fire	Fire
LH	RH	REAR DOOR	PITOT	LH LOW	RH LOW	GEAR	ext
Overvolt	Overvolt	Open Alert	Heat	Coolant	Coolant	Pump on	Power

In event of LH or RH GENERATOR caution light turned ON, apply following procedure:

1. FIELD LH (or RH)

OFF

2. FIELD LH (or RH)

ON

If the LH (or RH) GENERATOR caution stays displayed

3. FIELD LH (or RH)

OFF

4. Avionic LH

OFF

5. ADF

OFF

Switching OFF avionic LH and ADF will permit to shed non essential electrical power.

The battery and a single generator are able to supply the electrical power necessary for flight, but redundancy is lost.

If conditions permit:

Switching CROSS BUS OFF will further reduce alternator load; the decision mainly depends on weather conditions.

6. CROSS BUS LH (or RH)

OFF

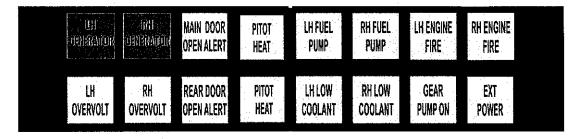

Equipment will be lost accordingly to the following table:

LH Gen Bus	LH Avionic Bus	RH Avionic Bus	RH Gen Bus
Pitot Heat	DME	ADF	NAV Lights
Landing Light	Transponder	COM 2	Rudder Trim
Taxi Light	Encoder Altimeter	NAV 2	Stall Warning
<u> </u>		A/P	RH attitude indicator
		A/P Pitch Trim	

7. Land as soon as practicable

2.2. BOTH GENERATORS FAILURE

In event of both LH and RH GENERATOR caution lights turned ON:

1. FIELD LH and RH

 $BOTH\ OFF$

2. FIELD LH and RH

BOTH ON

If the LH (or RH) GENERATOR caution stays displayed

- 3. Verify good ammeter indications on restored alternator
- 4. Refer to Single generator failure / overvoltage drill (Para 2.1)

If both LH and RH GENERATOR cautions stay displayed

3. FIELD LH and RH

BOTH OFF

4. CROSS BUS LH and RH

BOTH OFF

If engine starting battery modification is applied

5. EMERG BATT switch

ON

6. Land as soon as practical.

If engine starting battery modification is not applied

5. Land as soon as possible.

Equipment will be lost accordingly to the following table:

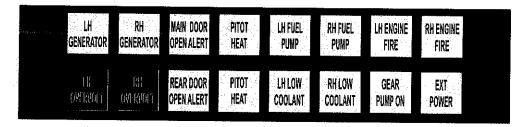

LH Gen Bus	LH Avionic Bus	RH Avionic Bus	RH Gen Bus
Pitot Heat	DME	ADF	NAV Lights
Landing Light	Transponder	COM 2	Rudder Trim
Taxi Light	Encoder Altimeter	NAV 2	Stall Warning
		A/P	RH attitude indicator
		A/P Pitch Trim	

The battery alone can supply electrical power for at least 30 minutes.

2.3. BOTH GENERATORS OVERVOLTAGE

In event of both LH and RH OVERVOLT warning lights turned ON:

1. FIELD LH and RH

BOTH OFF

2. FIELD LH and RH

BOTH ON

If the LH (or RH) GENERATOR caution stays displayed

- 3. Verify good ammeter indications on restored alternator
- 4. Refer to Single generator failure / overvoltage drill (Para 2.1)

If both LH and RH OVERVOLT warning stay displayed

3. CROSS BUS LH and RH

BOTH OFF

4. FIELD LH and RH

BOTH OFF

5. FIELD LH and RH

BOTH ON

If LH (or RH) OVERVOLT warning stays displayed

- 6. Verify good ammeter indications on restored alternator
- 7. Switch CROSS BUS on the restored alternator side
- 8. Refer to Single generator failure / overvoltage drill (Para 2.1)

If both LH and RH OVERVOLT warning stay displayed

6. FIELD LH and RH

BOTH OFF

If engine starting battery modification is applied

7. EMERG BATT switch

ON

LH Gen Bus	LH Avionic Bus	RH Avionic Bus	RH Gen Bus
Pitot Heat	DME	ADF	NAV Lights
Landing Light	Transponder	COM 2	Rudder Trim
Taxi Light	Encoder Altimeter	NAV 2	Stall Warning
<u> </u>		A/P	RH attitude indicator
		A/P Pitch Trim	

8. Land as soon as practical.

If engine starting battery modification is not applied

7. Land as soon as possible.

Equipment will be lost accordingly to the following table:

The battery alone can supply electrical power for at least 30 minutes.

4th Edition, Rev. 0

2.4. FAILED DOOR CLOSURE

LH RH	OR OPENALERI HEAT	LH FUEL RH FUE	LH ENGINE	RH ENGINE
Generator Genera		Pump Pump	Fire	FIRE
LH RH	REAR OOOR PITOT	LHLOW RHLOW		EXT
Overvolt overvo	OPEN ALERT HEAT	COOLANT COOLAN		Power

In case of door opening / unlocking, related MAIN or REAR DOOR ALERT warning light turns ON.

ON THE GROUND

1. Passengers and crew seat belts

Fasten and tighten

2. Affected door

Verify correctly closed

If door is open

3. Relevant engine

Shut down

4. Affected door

Close and check

If door is closed

3. Locking device

Check

If down in unlocked position

4. Abort mission.

IN FLIGHT

1. Passengers and crew seat belts

Fasten and tighten

2. Affected door and locked device

Verify correctly closed

If door is open or locking device is unlocked

3. Land as soon as possible

2.5. PITOT HEATING SYSTEM FAILURE

LH	RH	MAIN DOOR	1940	LH FUEL	RH FUEL	LH ENGINE	RH ENGINE
Generator	Senerator	Open Alert	1941	Pump	Pump	Fire	FIRE
LH OVERVOLT		REAR DOOR Open Alert	PITOT	LH LOW COOLANT	RH LOW Coolant	GEAR Pump on	EXT Power

When the Pitot Heating system is activated, the green PITOT HEAT advisory light is turned ON.

If the amber PITOT HEAT caution light turns OFF, then the Pitot Heating system is functioning properly. Anytime the amber PITOT HEAT caution light is ON at the same time the green PITOT HEAT light is ON, then the Pitot Heating system is not functioning properly.

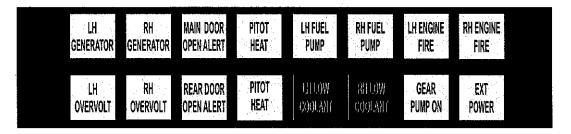

1.	Pitot heat switch	OFF
	a not nout synton	OFT

- 2. Verify Pitot Heating circuit breaker is IN
- 3. Pitot heat switch ON
- 4. Check PITOT HEAT caution light:

If the amber light stays ON, assume a failure in the pitot heating system. Avoid visible moisture and OATs below 10 deg C.

2.6. COOLANT LIQUID LOW LEVEL

When the engine coolant liquid level goes under the lower limit, the related LH or RH LOW COOLANT is turned ON. This condition may lead to high CHT/CT. When the warning light turns ON, apply following procedure:

1. Check affected engine CHT/CT

If CHT is above 135°C or CT is above 120°C

2. Affected engine

Reduce power setting to reduce CHT/CT up to the minimum practical

3. Land as soon as practical

If CHT/CT continues to rise and engine shows roughness or power loss

4. Affected engine

SECURE (see engine securing procedure on Para. 3)

5. Land as soon as possible applying one engine inoperative landing procedure. See Para. 6.6

2.7. GEAR PUMP FAILURE

LH	RH	MAIN DOOR	PITOT	LH FUEL	RH FUEL	LH ENGINE	RH ENGINE
Generator	Generator	Open Alert	HEAT	PUMP	Pump	Fire	Fire
LH	RH	REAR DOOR	PITOT	LH LOW	RH LOW	CTAR	EXT
Overvolt	Overvolt	Open Alert	HEAT	COOLANT	COOLANT	PURPOR	POWER

The GEAR PUMP ON caution light turns ON when the landing gear hydraulic pump is electrically supplied.

After the landing gear retraction, if the red TRANS light turns OFF and the GEAR PUMP ON caution stays turned ON, this could indicate a gear pump relay failure to ON.

If TRANS light is OFF

1. Continue the mission monitoring the caution light.

If TRANS light is ON

2. Landing gear is not locked in UP position

The electrical gear pump, continuously supplied, causes a current absorption which does not affect the mission unless this failure is coupled with the overall electrical failure. In this case, the residual battery endurance may be consistently lower than 30 minutes.

2.8. ENGINE FIRE

LH Generator	RH MAIN DOC Generator open Alei	LH FUEL Pump	RH FUEL Pump	日前GME 開稿	RU SHONE FIRE	u se in mesu i di
LH Overvolt	RH REAR DOC Overvolt open Ale	 LH LOW COOLANT	RH LOW COOLANT	GEAR Pump on	EXT Power	

In event of engine fire, LH or RH ENGINE FIRE warning light will turn ON. Refer to following procedures:

FIRE ON THE GROUND:

FIRE DURING TAKEOFF RUN:

FIRE IN FLIGHT:

see Para. 8.1

see Para, 8.2

see Para. 8.3

3. **ENGINE SECURING**

Following procedure is applicable to shut-down one engine in flight:

1. Throttle Lever

2. Ignition

3. Propeller Lever

4. Fuel Selector

5. Electrical fuel pump

IDLE

BOTH OFF

FEATHER

OFF

OFF

After securing engine(s), after analysing situation, refer immediately to following procedures:

ENGINE FAILURE IN FLIGHT:

see Para. 6.5

SINGLE GENERATOR FAILURE:

see Para. 2.1

or BOTH GENERATOR FAILURE:

see Para, 2.2

INFLIGHT ENGINE RESTART:

see Para, 6.2

ONE ENGINE INOPERATIVE LANDING:

see Para. 6.6

or LANDING WITHOUT ENGINE POWER:

see Para, 10.1

POWERPLANT EMERGENCIES

PROPELLER OVERSPEEDING

The aircraft is fitted with propeller/governor set by MT-Propeller such a way that the maximum propeller rpm exceedance is prevented. In case of propeller overspeeding in flight, apply following procedure:

1. Throttle Lever 2. Propeller Lever REDUCE power to minimum practical

REDUCE as practical (not in feathering)

3. RPM indicator

CHECK

If it is not possible to decrease propeller rpm, apply engine securing procedure (see Para. 3) and land as soon as possible applying one engine inoperative landing procedure (See Para. 6.6).

Maximum propeller rpm exceedance may cause engine components damage. Propeller and engine shall be inspected in accordance with related Operators Manuals.

4.2. CHT/CT LIMIT EXCEEDANCE

If CHT/CT exceeds its limit, apply following procedure:

Check affected engine CHT/CT

If CHT is above 135°C or CT is above 120°C

2. Affected engine

Reduce power setting to reduce CHT/CT up to

the minimum practical

3. Land as soon as practical

If CHT/CT continues to rise and engine shows roughness or power loss

4. Affected engine

SECURE (see engine securing procedure on

Para. 3)

5. Land as soon as possible applying one engine inoperative landing procedure. See Para. 6.6

4.3. OIL TEMPERATURE LIMIT EXCEEDANCE

If oil temperature exceeds maximum limit (130°C):

1. OIL PRESS

CHECK

If oil pressure is within limits

2. Affected engine

Reduce power setting to minimum applicable

3. Affected engine

Keep propeller speed higher than 2000 RPM

If oil temperature does not decrease

4. Airspeed

INCREASE

If oil temperature does not come back within limits, the thermostatic valve, regulating the oil flow to the heat exchangers, could be damaged or an oil leakage can be present in the oil supply line.

- 5. Land as soon as practical keeping the affected engine to the minimum necessary power
- 6. Monitor OIL PRESS and CHT/CT

if engine roughness / vibrations or erratic behaviour is detected:

7. Affected engine

SECURE (see engine securing procedure on Para. 3)

8. Land as soon as possible applying one engine inoperative landing procedure. See Para. 6.6

Excessive oil pressure drop leads to a high pitch propeller configuration with consequent propeller feathering and engine stopping.

4.4. OIL PRESSURE LIMITS EXCEEDANCE

If oil pressure exceeds its lower or upper limit (0.8 - 7 bar), apply following procedure:

Excessive oil pressure drop leads to a high pitch propeller configuration with consequent propeller feathering and engine stopping.

An excessive oil pressure value can be counteracted by decreasing propeller rpm.

1. OIL PRESS

CHECK

If oil pressure exceeds upper limit (7 bar)

2. Throttle Lever

first REDUCE affected engine power by 10%

3. Propeller Lever

Keep low rpm

4. OIL PRESS

CHECK (verify if within limits)

5. Land as soon as practical

If oil pressure is under the lower limit (0.8 bar)

2. Land as soon as practical

If oil pressure is continuously decreasing

3. Affected engine

SECURE (see engine securing procedure Para. 3)

4. Land as soon as possible applying one engine inoperative landing procedure. See Para. 6.6

4.5. LOW FUEL PRESSURE

If fuel pressure decreases below the lower limit (2.2 psi), apply following procedure:

1. Fuel press

CHECK

2. Fuel quantity

CHECK

3. Fuel consumption

MONITOR

If a fuel leakage is deemed likely

4. Land as soon as possible.

If a fuel leakage can be excluded:

4. Electrical fuel pump

ON

5. Feed the affected engine by means of opposite side fuel tank

If pressure does not come back within the limits

6. Land as soon as practical

5. OTHER EMERGENCIES

5.1. EMERGENCY DESCENT

Descent with airspeed at VLE, idle power and gear down will provide high descent rates and pitch attitudes up to -15°.

Anticipate altitude capture and return to level flight during emergency descent in order to assure a safe and smooth recovery from maneuver.

1.	Power levers	IDLE
2.	Flaps	$U\!P$
3.	IAŠ	below VLO/VLE
4.	Landing gear	DOWN
5.	Airspeed	Up to VLO/VLE

5.2. TOTAL ELECTRICAL FAILURE

In case of electrical system overall failure, apply following procedure:

1.	Emergency light	ON if necessary
2.	Standby attitude indicator switch	ON
3.	MASTER SWITCH	OFF
4.	FIELD LH and RH	BOTH OFF
5.	MASTER SWITCH	ON
6	FIELD LH and RH	BOTHON

If failure persists

9. EMERG BATT switch

ON (if engine starting battery installed)

10. Land as soon as possible applying emergency landing gear extension procedure (see Para. 7.1)

An electrical system overall failure prevents flaps operation: landing distance without flaps increases of about 25%.

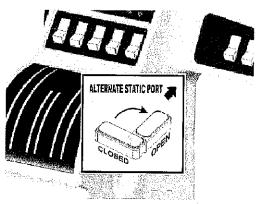

A fully charged battery can supply electrical power for at least 30 minutes.

5.3. STATIC PORTS FAILURE

In case of static ports failure, the alternate static port in the cabin (shown below) must be activated.

- 1. Cabin ventilation
- 2. ALTERNATE STATIC PORT VALVE
- 3. Continue the mission

OFF (hot and cold air) OPEN

5.4. Unintentional flight into icing conditions

1. Carburettor heat

BOTH ON

2. Pitot heat

ON

- 3. Fly as soon as practical toward a zone clear of visible moisture, precipitation and with higher temperature, changing altitude and/or direction.
- 4. Control surfaces

Move continuously to avoid locking

5. Propellers rpm

INCREASE to prevent ice build-up on the blades

In event of ice build-up in correspondence of wing leading edges, stall speed increases.

Ice build-up on wing, tail fin or flight control surfaces unexpected sudden roll and/or pitch tendencies can be experienced and may lead to unusual attitude and loss of aircraft control.

Do not use Autopilot when icing formation is suspected or detected.

5.5. CARBURETTOR ICING

DURING TAKEOFF

The carburettor icing in "full throttle" mode is unlikely.

Take off in known or suspected icing condition is forbidden.

Therefore, and in order to dispose of full engine take off power, the take-off must be performed with carburettor heating OFF.

IN FLIGHT

Carburettor icing is considered probable when external air temperature is below 15° C and visible air moisture (clouds, mist, haze or fog) or atmospheric precipitation are present.

Generally, an OAT-to-dew point temperature spread lower than 10°C and OAT less than 15°C with visibility lower than 5 km is a positive indication of likely icing formation condition.

Should an inadvertent flight into known or forecast icing condition happen carburettor heating should be selected "ON" as soon as possible: the earlier carburettors are warmed the better the chances not to form ice and avoid engine loss or reduction of power.

Keep Carb Heating "ON" until engine power is restored and area of possible icing condition is exited.

Carburettor Heating to "ON" will cause engine RPM reduction of about 100 RPM, causing a sensible available engine power decrease.

5.6. FLAPS CONTROL FAILURE

DURING TAKEOFF

Flap UP take off, requires a T/O distance (50 ft height obstacle distance) increased by about 20%.

Airspeed

Keep below 93 KIAS

Land as soon as practical

DURING APPROACH/LANDING

If the flaps control fails, consider the higher stall speed (see Section 5, Para 6 (Stall Speed) and an increased landing distance of about 25%.

1. Airspeed

Keep over 75 KIAS

2. Land as soon as practical on a runway of appropriate length

5.7. **ELECTRICAL PITCH TRIM CONTROL FAILURE**

a) Trim Runaway:

In the event of trim runaway:

1. AP DISC switch (if AP is installed)

PRESS and HOLD

2. TRIM DISC switch

OFF

3. AP DISC switch (if AP is installed)

RELEASE

4. Trim aircraft using trim wheel

b) Trim Jamming:

Should trim control be jammed / inoperative:

1. Pitch trim breaker

CHECK

If circuit breaker is OUT:

2. Trim aircraft using trim wheel

If circuit breaker is IN:

2. TRIM DISC switch

OFF

3. Trim aircraft using trim wheel

6. ONE ENGINE INOPERATIVE PROCEDURES

The ineffectiveness of one engine results in asymmetric traction which tends to yaw and bank the aircraft towards the inoperative engine. In this condition it is essential to maintain the direction of flight compensating the lower traction and counteracting the yawing effects by mean of rudder pedals. To improve directional control, it is advisable to bank the aircraft of about 5° to the side of the operating engine.

In addition, reduced available overall power and extended control surfaces will lead to a performances drop: a quick pitch attitude reduction will allow to keep a minimum safety airspeed.

The higher is the airspeed the better will be lateral and directional control efficiency: never allow airspeed to drop below V_{MCA} .

Best residual climb performances in OEI (One Engine Inoperative) condition have been recorded in Flap Up configuration and at V_{YSE} , which is marked as a Blue Line on the Airspeed indicator (calculated for maximum Take Off Weight and Sea, Level ISA condition) For actual condition V_{YSE} refer to Section 5 Para. 13 (One engine rate of climb).

 $V_{\rm XSE}$ is actually very close to $V_{\rm YSE}$ in any condition, thus best climb performance will also be associated with best climb angle (gradient) performance. Refer to Section 5 Para. 14, One-Engine Rate of Climb at $V_{\rm xSE}$, for relevant data.

6.1 CHARACTERISTIC AIRSPEEDS WITH ONE ENGINE INOPERATIVE

In case of one engine inoperative condition (OEI), pilot shall take into account the airspeeds shown below:

Conditions	Speed (KIAS)	
Minimum aircraft control speed with one engine inoperative and flaps set to T.O. (V_{MC})	62	
Doct note of alimb around OCL (V.)	MTOW 1180 kg	MTOW 1230 kg
Best rate-of-climb speed OEI (V_{YSE})	80	84
Best gradient speed OEI (V _{XSE})	79	83

Reference is made to MTOW, 1180 kg and 1230 kg, at Sea Level and ISA condition (if Supplement A19 - Increased MTOW @1230 KG - is applicable).

6.2 INFLIGHT ENGINE RESTART

After:

- mechanical engine seizure;
- fire.
- major propeller damage

engine restart is not recommended.

Carburettor heat

2. Electrical fuel pump

3. Fuel quantity indicator

4. Fuel Selector

5. FIELD

6. Ignition

7. Operating engine Throttle Lever

8. Stopped engine Throttle Lever

Stopped engine Propeller Lever

10. Start push-button inoperative engine

2. Rudder Keep heading control

Brakes

As required

When safely stopped:

Failed Engine Ignition

BOTH OFF

Failed Engine Field

OFF

Failed Engine Electrical fuel pump

OFF

IF THE DECISION IS TAKEN TO CONTINUE THE TAKEOFF:

A take-off abort should always be preferred if a safe stop can be performed on ground.

A suggested "GO-NO-GO" criteria is: abort take-off until LG is still down and locked.

Once airborne accelerate to Blue Line Speed (VYSE) before commanding LG retraction.

Take-off planning should take into account that high density altitude and aircraft mass may result in OEI negative climb rate.

V_{YSE} with flap up shall be flown in order to achieve best possible rate of climb after landing gear retraction and engine feathering.

7. LANDING GEAR FAILURES

7.1. **EMERGENCY LANDING GEAR EXTENSION**

Landing gear extension failure is identified by means of the green lights not illuminated: relevant gear leg may not be fully extended and/or locked.

Light bulb operating status can be verified by pressing the LDG push-to-test button. Additionally, the red light TRANS indicates that one or more legs are moving and the PUMP ON amber light on the annunciator panel indicates the hydraulic gear pump is operating.

Main Landing Gear legs green lights may be turned on, thus indicating effective main gear legs blocked in down position by mere effect of gravity force.

LH control lever 6.

ROTATE 180° counterclockwise

7. Land as soon as practical

The emergency landing gear extension operation takes about 20" sec.

7.2. COMPLETE GEAR UP OR NOSE GEAR UP LANDING

The following procedure applies if Nose Landing Gear is not extended and locked even after emergency extension procedure.

A Nose Landing Gear up leg not down and locked might lead to a hazardous situation, especially on uneven runways.

If landing gear position is not known, perform a tower fly-by at safe speed and altitude to have confirmation about its situation.

If possible coordinate fire brigade intervention along runway and report number of persons on board and remaining fuel type and quantity.

If a complete Landing Gear up or a Nose Landing Gear up position is reported:

4th Edition, Rev. 0

Consider use of ditching emergency exit to escape in case pilot or passenger doors are blocked, watch for engine hot parts, fuel, hydraulic fluid or oil spills. Leave aircraft in upwind di-

7.3. PARTIAL MAIN LG EXTENSION

The following procedure applies if one or both Main Landing Gear legs are not completely extended and locked even after emergency extension procedure.

A partial gear landing (RH and/or LH leg not down and locked) might turn into a hazardous situation, especially on uneven runways.

If possible try to obtain a symmetric gear extension (e.g. by trying further landing gear retraction) in order to avoid swerving after touchdown. A gear up landing is generally considered safer.

If landing gear position is not known, perform a tower fly-by at safe speed and altitude to have confirmation about its situation.

If possible coordinate fire brigade intervention along runway and report number of persons on board and remaining fuel type and quanti-

Page 3 - 44

9. Unintentional spin recovery

Spin behaviour has not been demonstrated since certification process does not required it for this aircraft category.

Intentional spin is forbidden.

Stall with one engine inoperative is forbidden.

Should an unintentional spin occur, the classic recovery maneuvre is deemed as being the best action to undertake:

1. Both engines throttles

2. Flight Controls

3. Rudder

idle centralize

fully against rotation until it stops

INTENTIONALLY LEFT BLANK

10. LANDING EMERGENCIES

10.1 LANDING WITHOUT ENGINE POWER

In case of double engine failure both propellers should be feathered to achieve maximum efficiency. Best glide speed is attained with flap UP and equals V_Y for current aircraft mass and air density altitude. Refer to Section 5, Para. "Enroute Rate of Climb".

Normal landing gear extension requires MASTER switch ON, an efficient battery and takes around 20 seconds.

LG selection should be appropriately anticipated when sure on final.

Flap can be set to T/O or LAND when landing is assured on final to reduce landing ground roll on short field.

Touchdown speed can be as low as 50 kt with flap down.

INTENTIONALLY LEFT BLANK

4th Edition, Rev. 0

1. INTRODUCTION

Section 4 describes checklists and recommended procedures for the conduct of normal operations for **P2006T** aircraft.

1.1. NORMAL OPS GENERAL RECOMMENDATIONS

The following points should be always brought to attention to pilot/instructor/operator when operating a Tecnam aircraft equipped with variable pitch propeller:

1. Propeller governor ground check.

As prescribed by the propeller/governor manufacturer, a drop of 400/500 propeller RPM should be produced during this check. Its aim is to confirm the governor efficiency, not its complete feathering function.

Especially during the first cycle of propeller lever pulling, the governor tendency is to respond to the input with consistent delay, causing the pilot to continue moving back the propeller lever until an abrupt RPM change is observed. This causes an excessive drop in propeller speed that may reach up to 800 RPM in some cases and, consequently, a drop of up to 2000 engine shaft RPM. The long term result is a major wear of engine gearbox, bushings and pistons. In some cases, it may also result in detonation.

In order to avoid these long term adverse effects, the governor ground check should be performed by slowly and gently pulling the propeller lever. The purging cycle should be repeated 3 times, making sure that the governor closely and firmly controls the rpm.

The following recommendations have to be followed during the test:

- propeller speed drops shall be of 400/500 propeller RPM
- the cycle shall be repeated 3 times
- the pilot shall be ready to push the propeller lever if a drop of >500 RPM is recorded

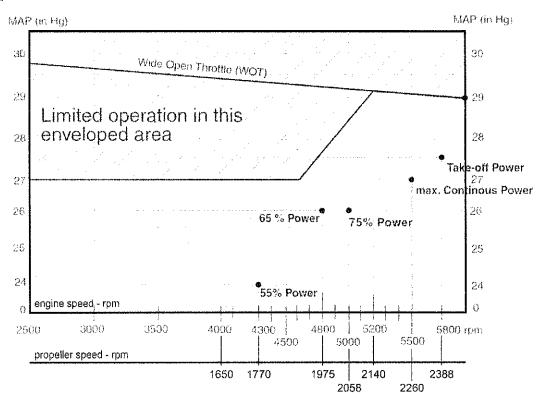

2. Power changes.

When power setting changes are required in any flight condition, remember the following correct procedure:

- Power increase = FIRST Prop THEN Map
- Power reduction = FIRST Map THEN Prop

Useful guideline chart that could be used for best propeller/manifold combination is following reported:

3. Suitable Fuels.

Tecnam remember operators to fill the aircraft with approved and suitable fuels. Use of not approved/unknown fuels may cause damages to the engine.

ONLY USE APPROVED FUELS

For details refer to Section 2 of this manual (or applicable Supplement) and latest issue of Rotax SI-912-016

2. AIRSPEEDS

2.1. NORMAL OPERATIONS

The following airspeeds are those which are significant for normal operations, with reference to both MTOW: 1180 kg and 1230 kg (if Supplement A19 - Increased MTOW @1230 KG - is applicable).

	:	MTOW	
	FLAPS	1180kg	1230 kg
Rotation Speed (in takeoff, V_R)	T/O	64 KIAS	65 KIAS
Best Angle-of-Climb Speed (V _X)	0°	73 KIAS	72 KIAS
Best Rate-of-Climb speed (V _r)	00	80 KIAS	84 KIAS
Approach speed	T/O	90 KIAS	90 KIAS
Final Approach Speed	FULL	70 KIAS	71 KIAS
Manoeuvring speed (V _A)	0°	118 KIAS	122 KIAS
Never Exceed Speed (V _{NE})	0°	167 KIAS	171 KIAS

2.2. SINGLE ENGINE TRAINING

 V_{SSE} is a speed selected as training aid for pilots in the handling of multi-engine aircraft. It is the minimum speed for intentionally rendering on engine inoperative in flight. This minimum speed provides the margin the manufacturer recommends for us when intentionally performing engine inoperative manoeuvres during training. The best practice to perform single engine training is to retard one engine to the flight parameters equivalent to a dead engine.

A simulated feather condition is obtained with propeller lever full forward and throttle lever set at 13.5 in Hg MAP at 70-90 KIAS and 2000-4000 ft (density altitude).

Recommended safe simulated OEI speed (V_{SSE})	70 KIAS
(* DDE)	

Keep speed above V_{SSE} for simulated OEI training operations.

In normal operations, shutting down an engine for training shall not become a habit, in particular for safety reasons and in order to optimise training; engine shutdown to perform OEI shall be executed only when required by regulations (e.g. during flight check, skill tests or demonstration as per 14CFR Part61 or equivalent rule).

The continuous operation of engine securing for training may indeed cause long term damages to the engine itself due to the high load coming from propeller (which is in feathering angle during the engine re-starting).

Normal procedures checklist

3.1. RECOMMENDATIONS FOR COLD WEATHER OPERATIONS

Engine cold weather operation

Refer to Rotax 912 Series Operators Manual, last issue, providing instructions for operating media (lubricant and coolant specifications) to be used in cold weather operation.

Parking

When the airplane is parked in cold weather conditions and it is expected to be soaked at temperatures below freezing, some precautions need to be taken.

Clear snow, slush, and ice in the parking area, or at least clear the area around the tires to prevent them from freezing to the ground. Apply plugs on Pitot and static ports.

The exposed airframe parts should be protected, especially the engines, the wheels, the blades and the gears against the snow or ice accumulation. Water and other freezable liquids should be removed from the airplane.

Standing water that could freeze should be removed from critical parts, as flaps and ailerons hinges, trim tabs hinges, drain points, LG doors, cabin doors etc.

With an ambient temperature of below -20°C, remove battery and store in a warm dry place; additionally in order to prevent a heavy discharge and to increase the battery life time, it is recommended to use an external power source for engine starting at temperatures lower than -15°C.

When wheel brakes come in contact with ice, slush, or snow with freezing conditions, the brake disk may freeze: park the aircraft with parking brake control knob in OFF position and ensure the aircraft is properly chocked and moored.

In any case, when the probability of ice, snow, or heavy frost is forecast, the use of a hangar is strongly recommended.

An external inspection of the aircraft is performed before each flight, as prescribed on Section 3.1.

For cold weather operations, the crew must focus on the check of following parts of airplane (free of snow/ice/standing water).

- control surfaces
- fuselage
- wings
- vertical and horizontal stabilator
- stall warning switch
- engine inlets
- engines draining points
- propeller blades
- LG doors
- Pitot, and static ports
- fuel tank vents

Tires show low pressure in cold weather: the required adjustments to inflation pressure should be performed on tires cooled to ambient temperature.

If the crew detects ice, anti-icing products are not allowed. To remove ice, tow the aircraft in the hangar and operate with a soft brush or a humid cloth.

Removal of snow/ice accumulations is necessary prior to take-off because this will seriously affect airplane performance. Aircraft with ice/snow accumulation is not cleared for flight.

If the aircraft must be operated in cold weather conditions within the range -25°C to -5°C, it is suggested to perform following procedure in order to speed up the engine warm-up:

- Tow the airplane in a warm hangar (warmer than -5°C);
- Let airplane temperature stabilize;
- Check pressure in hydraulic system, recharge if necessary;
- Heat the cabin to a suitable value to avoid windshield frost in flight; an electrical fan heater may be used inside the cabin;
- Tow airplane outside and perform engine starting.

3.2. PRE-FLIGHT CHECK - AIRCRAFT WALK-AROUND

To perform the aircraft walk-around, carry out the checklists according to the pattern shown in Figure 4-1.

If ignition switches are turned ON, a propeller movement can cause the engine starting with consequent hazard for people nearby.

Visual inspection is defined as follows: check for defects, cracks, delamination, excessive play, unsafe or improper installation as well as for general condition, presence of foreign objects, slippage markers etc. For control surfaces, visual inspection also involves additional check for freedom of movement. Always check the ground in the area of the aircraft for evidence of fuel, oil or operating fluids leakages.

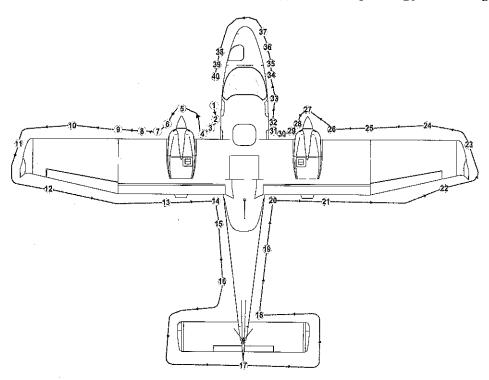

Figure 4.1

1	Pilot door and cabin	Check door for
		ter Switch and

r integrity. Turn ON the Masd check Stall Warning switch for operation and condition; check lighting of Landing/Taxi/Nav/Strobe lights then turn OFF the Master Switch.

2 Left main landing gear

Check fuselage skin status, tire status (cuts, bruises, cracks and excessive wear), slippage markers integrity, gear structure and shock absorber, hoses, gear door attachments and gear micro-switches. There should be no sign of hydraulic fluid leakage.

3 Wheel chock

Remove if employed

Propeller and spinner

The propeller blades and spinner should be free of cracks, nicks, dents and other defects and should rotate freely. Check fixing and lack of play between blades and hub.

Left engine nacelle

Perform following inspections:

a) Check the surface conditions.

- b) Nacelle inlets and exhausts openings must be free of obstructions. If inlet and outlet plugs are installed, they should be removed.
- c) Check radiators. There should be no indication of leakage of fluid and they have to be free of obstructions.
- *d)* Only before the first flight of a day:
- (1) Verify coolant level in the expansion tank, replenish as required up to top (level must be at least 2/3 of the expansion tank).
- (2) Verify coolant level in the overflow bottle through the slot under the nacelle: level must be between min. and max. mark. Replenish if required removing the upper cowling; after that, install upper cowling checking for interferences with radiators.
- (3) Turn the propeller by hand to and fro, feeling the free rotation of 15°or 30° before the crankshaft starts to rotate. If the propeller can be turned

between the dogs with practically no friction at all further investigation is necessary. Turn propeller by hand in direction of engine rotation several times and observe engine for odd noises or excessive resistance and normal compression.

- e) Check oil level and replenish as required. Prior to oil check, switch off both ignitions circuits and turn the propeller by hand in direction of engine rotation several times to pump oil from the engine into the oil tank. This process is finished when air is returning back to the oil tank and can be noticed by a murmur from the open oil tank. Prior to long flights oil should be added so that the oil level reaches the "max" mark.
- f) Drain off Gascolator for water and sediment (drain until no water comes off). Then make sure drain valve is closed.
- g) Check drainage hoses clamps
- h) Verify all parts are fixed or locked.
- Verify all inspection doors are closed.

- Air induction system
- Left fuel tank
- Landing and taxi lights 8
- Left wing leading edge
- 10 Left wing top and bottom panels 11 Left winglet, nav and strobe
- lights, static discharge wick 12 Left aileron and balance mass

Check engine air inlet for integrity and correct fixing. The air intake filter must be free of obstructions.

Check that the refuelling port cap is properly secured, then perform the fuel tank sump drainage operating the related valve which, after operation, must be checked closed. Fuel must checked for water and sediment. Verify the tank vent outlet is clear.

Visual inspection

Visual inspection. Check cabin ventilation inlet and carburettor heating inlet for condition and free of obstruction. Check stall strip.

Visual inspection

Check for integrity and fixing

Visual inspection, remove tie-down devices and control locks if employed.

25

3.9. TAKEOFF AND CLIMB

1	Landing light	ON	
2	LH and RH Electrical Fuel pump	BOTH ON	
3	Carburettors heat	CHECK OFF	
4	LH and RH Propeller Lever	FULL FORWARD)
5	LH and RH Throttle Lever	FULL POWER	
6	Engines instruments	Parameters within	green arcs
7	Rotation speed	MTOW 1180kg	MTOW 1230 kg
		Vr = 64 KIAS	Vr = 65 KIAS
8	Apply brakes to stop wheel spin- ning		
9	Landing gear control knob	UP: check green light turned OFF v	lights and TRANS within about 20"
10	Landing and taxi light	OFF when require	
11	LH and RH Propeller Lever	Set max cont powe	

Max take off power must be limited to 5 minutes. Reduce Throttles MAP power before retracting Propeller to 2200 RPM or below.

12 LH and RH Electrical Fuel pump **BOTH OFF**

It is recommended to retract landing gear when a positive climb rate is ensured at the applicable best speed (V_Y or V_X as necessary). It has been demonstrated that best climb rate is always obtained with flaps in UP position: refer to Section 5, "Take off rate of climb" and "Enroute rate of climb" tables.

Noteworthily best climb gradient speed (V_X) flaps UP is lower than best climb speed (V_X) flaps T/O up to 6000 ft (density altitude). Refer to Section 5, "Best climb gradient speed" table.

3.10. CRUISE

1 LH and RH Propeller Lever

SET to 1900-2250 RPM

Throttles MAP decrease should be made before propeller speed reduction below 2200 RPM, as, contrariwise, Propeller Lever increase RPM should be set before engine Throttle Levers are advanced.

2 Engine parameters check (LH and RH)

• Oil temperature:

90° - 110 ° C

(or 50° - 130° C, if MOD2006/002 is applied)

• CHT/CT:

50° - 135° / 50° - 120 °C

• Oil pressure:

2 - 5 bar.

• Fuel pressure:

2.2 - 5.8 psi *2.2 - 7.26 psi (0.15 - 0.50 bar)

*applicable for fuel pump part no.893110, 893114 and no.893115

3 Carburettor heat as needed (see also instructions addressed on Section 3

Deselect and do not use Auto Pilot if possible icing condition area is inadvertently entered.

4 Fuel balance and crossfeed

check as necessary

To evaporate possibly accumulated condensation water, once per flight day (for approximately 5 minutes) 100° C (212° F) oil temperature must be reached.

3.11. TURBULENT AIR OPERATION

In keeping with good operating practice used in all aircraft, it is recommended that when turbulent air is encountered or expected, the airspeed be reduced to maneuvering speed to reduce the structural loads caused by gusts and to allow for inadvertent speed build-ups, which may occur as a result of the turbulence or of distractions caused by the conditions.

3.12. DESCENT AND APPROACH

1 Propellers

As required

In order to control engine cooling and life, it is preferable to descend with power above idle and RPM lower than full continuous.

2 Carburettors heat

As required

3 Altimeter setting

QNH set and crosscheck

4 Rear passengers seats

Set at full aft position

3.13. **BEFORE LANDING**

Lock one control wheel with safety belt.

Wheel chocks
Aileron lock
Place and tighten
Pilot and passengers doors.

Close and latch

Protective cover for Pitot tubes, stall warning and stat-

3. GROUND TOWING, PARKING AND MOORING

4.1 Towing

Before to move the a/c on the ground, the Master Switch must be turned ON for at least 5 seconds.

To tow the aircraft it is necessary to use a metal stiff bar connected to the nose gear.

Do not turn nose wheel above 20° either side of center: greater steering angles can damage the wheel stop. The tow bar must be removed before engines starting.

4.2 PARKING

General

Under normal weather conditions, the airplane may be parked and headed in a direction that will facilitate servicing without regard to prevailing winds. Ensure that it is sufficiently protected against adverse weather conditions and present no danger to other aircraft.

Procedure

- 1. Position airplane on levelled surface, headed into the prevailing wind, if practical.
- 2. Engage parking brake and install control locks
- 3. Secure pilot control wheel by wrapping the seat belt around it.

Do not engage the parking brakes at low ambient temperature; accumulation of moisture may cause the brakes to freeze. In this case use wheel chocks.

In case of long time parking or overnight parking, it is recommended to moor the a/c as shown on Para. 4.3.

Mooring is strongly recommended when the wind is more than 15 knots and the a/c is completely refuelled.

4.3 MOORING

The aircraft is moored to insure its immovability, protection, and security under various weather conditions.

Mooring is strongly recommended when the wind is more than 15 knots and the a/c is completely refuelled.

Procedure

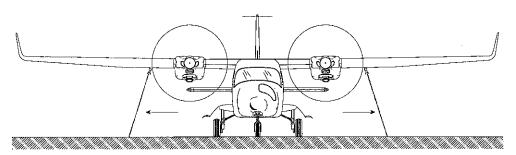

- 1. Position airplane on levelled surface and headed into the prevailing wind.
- 2. Center nose wheel, engage parking brake and/or use the wheel chocks.

NOTE:

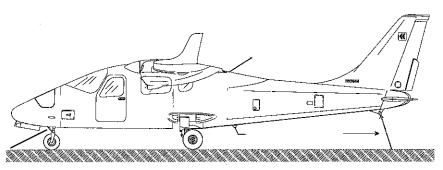

Do not engage the parking brakes at low ambient temperature; accumulation of moisture may cause the brakes to freeze. In this case use wheel chocks.

- 3. Secure pilot control wheel by wrapping the seat belt around it
- 4. Assure flaps are retracted
- 5. Electrically ground airplane, by connecting ground cable to the engine muffle
- 6. Install control locks and protective plugs.
- 7. Close and lock cabin doors.
- 8. Secure tie-down cables to the nose gear leg (in correspondence of the wheel fork) and to the wings and tail cone tie-down rings at approximately 45 degree with respect to the ground. (Refer to following figures)

Additional preparation for high winds includes tie-down ropes from the NOTE: main landing gear forks employment.

Increased MTOW (1230 kg) - Supplement

TECNAM P2006T - Aircraft Flight Manual Page W5 - 2

1. Introduction

This section provides all necessary data for an accurate and comprehensive planning of flight activity from takeoff to landing.

Data reported in graphs and/or in tables were determined using:

- "Flight Test Data" under conditions prescribed by EASA CS-23 regulation
- · aircraft and engine in good condition
- · average piloting techniques

Each graph or table was determined according to ICAO Standard Atmosphere (ISA - s.l.); evaluations of the impact on performances were carried out by theoretical means for:

- * airspeed
- *external temperature
- *altitude
- *weight
- *runway type and condition

2. Use of Performances Charts

Performances data are presented in tabular or graphical form to illustrate the effect of different variables such as altitude, temperature and weight. Given information is sufficient to plan the mission with required precision and safety.

Additional information is provided for each table or graph.

3. AIRSPEED INDICATOR SYSTEM CALIBRATION

Graph shows calibrated airspeed V_{CAS} as a function of indicated airspeed V_{IAS} .

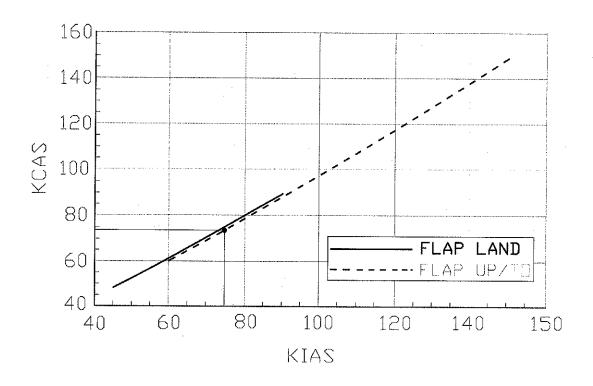

Figure 1 - IAS/CAS chart

INTENTIONALLY LEFT BLANK

1. INTRODUCTION

This section describes the procedure for establishing the basic empty weight and the moment of the aircraft. Loading procedure information is also provided.

Aircraft must be operated in accordance with the limits concerning the maximum takeoff weight and CG excursion as reported in Flight Manual Section 2.

Pilot is responsible for checking the weight and CG excursion are compliant with the related limits. CG excursion and weight limits are reported in Section 2 – Limitations.

TECNAM

WEIGHING PROCEDURES

2.1. **PREPARATION**

- Carry out weighing procedure inside closed hangar
- Remove from cabin any object unintentionally left
- Make sure Flight Manual and mandatory documents are on board
- Align nose wheel
- Drain fuel via the specific drain valve
- Oil, hydraulic fluid and coolant liquid at the operating levels
- Move sliding seats to most forward position
- Raise flaps to fully retracted position
- Place control surfaces in neutral position
- Place scales (min. capacity 300 kg) under each wheel

2.2. **LEVELLING**

- Level the aircraft (the reference for longitudinal levelling is made putting a spirit-level on the cabin floor as shown in the Aircraft Maintenance Manual).
- Adjust longitudinal attitude deflating nose tire

2.3. WEIGHING

- Record weight shown on each scale
- Repeat weighing procedure three times
- Calculate empty weight

DETERMINATION OF C.G. LOCATION 2.4.

- Drop a plumb bob tangent to the wing leading edge and trace a reference mark on the floor (see Figure on Para. 2.5 or 2.6)
- Repeat the operation for other wing
- Stretch a taught line between the two marks
- Measure the distance between the reference line and both main and nose wheel axis (A and B distances respectively)
- Using recorded data it is possible to determine the aircraft C.G. location and the aircraft moment (see following table)

Empty weight	We =	[kg] or [lbs]	
Max. useful load W _T - We	Wu =	[kg] or [lbs]	

WEIGHTS AND C.G.

C.G. position can be defined by means of the chart below.

The pilot is responsible for ensuring the correct useful load loading.

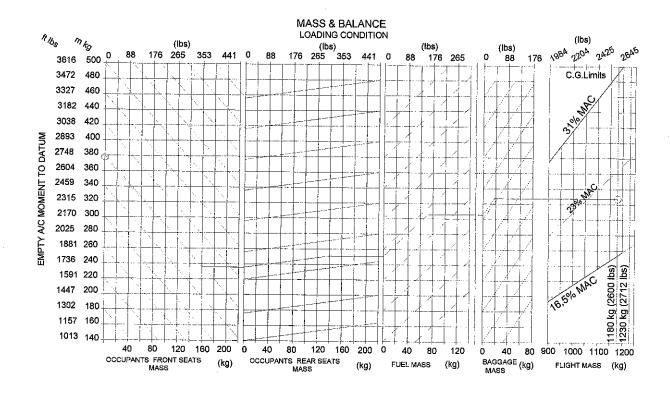

Figure 1

Example

A/C empty mass m	oment 378 kgm
A/C empty mass	790 kg
Occ. front seats	160 kg
Occ. rear seats	140 kg
Fuel	72kg
Baggage	18 kg
A/C T.O. weight	1180kg

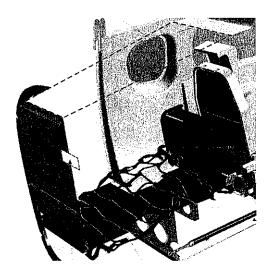

BAGGAGE LOADING

The baggage loading in the dedicated compartment must be carried out in accordance with diagram addressed on PAR. 03 and with C.G. excursion and weight limitations reported in Section 2.

Pilot is provided with a red tie-down net and snap fasteners allowing for securing the loads on the compartment floor.

Loading the baggage, make sure that you correctly stretched the net which must be secured to the four vertices of the floor.

4. EQUIPMENT LIST

The following is a list of equipment which may be installed in the **P2006T**. The items marked with an "X" were installed on the airplane described at the beginning of the list and they are included in the Basic Empty Weight.

It is the owner's responsibility to retain this equipment list and amend it to reflect changes in equipment installed in this airplane.

1. INTRODUCTION

This section provides aircraft and systems description and operation.

2. AIRFRAME

2.1. WING

Each wing consists of a central light alloy torque box which carries all the wing bending, shear and torque loads; an aluminium leading edge is attached to the front spar while flap and aileron are hinged to the rear spar.

The torque box houses an integrated fuel tank and supports the engine mount.

Flap and aileron, respectively located inboard and outboard of wing and made up of light alloy, are constructed with a central spar to which front and rear ribs are jointed. Wrapped-around aluminium stressed skin panels cover all the structures. Steel alloy attachments connect left and right wing to each other.

Following figure shows the left wing fitted with the engine nacelle, fuel tank and composite winglet. Steel alloy attachments link left and right wing to each other.

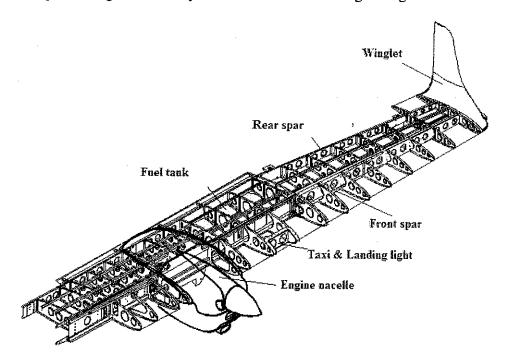

Figure 1. - Left wing structure

2.2. **FUSELAGE**

The fuselage is constituted by a light-alloy semi-monocoque structure wrappedaround by stressed skin panels. Radome and stern fairing are of composite material. Cabin and baggage compartment floor is a warping of beams and keelsons supporting the seats guides and other components.

Two spar frames support on the top the wings attachments and on the bottom the sponson beans sustaining the main landing gear. The forward frame, to which radome is connected, supports a steel trestle to which the nose landing gear is connected.

The front and rear seats access occur by means of two doors located in the opposite sides of the fuselage; a ditching emergency exit is available on the top of the cabin. In tail cone, two spar frames support the horizontal and vertical empennages attachments.

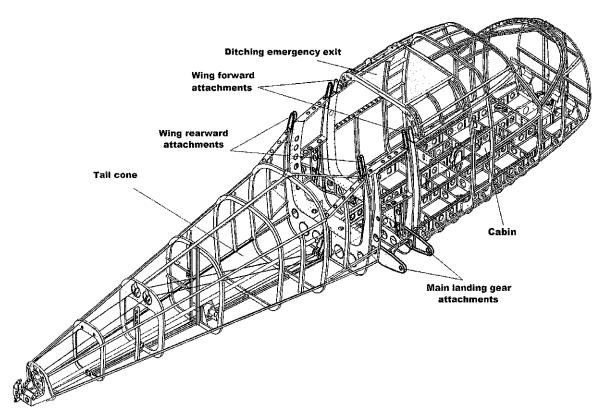

Figure 2. - Fuselage structure

2.3. EMPENNAGES

The vertical tail is entirely metallic: vertical fin is made up of a twin spar with aluminium alloy stressed skin. Rudder, providing directional control of the airplane, is made up of aluminium alloy.

The rudder is connected to the vertical tail at two hinge points. A trim tab system increases directional stability of the airplane.

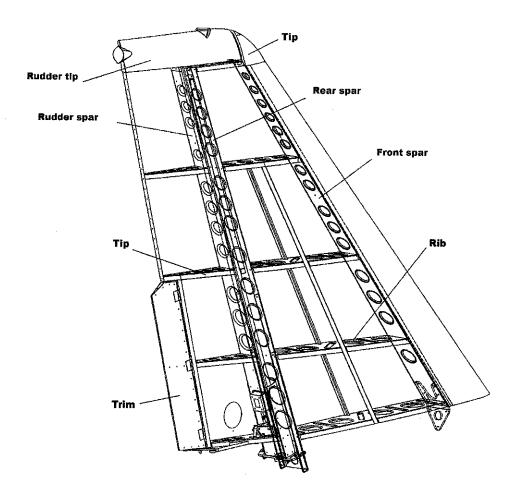

Figure 3. - Vertical empennage structure

The horizontal empennage is an all-moving type (stabilator); its structure consists of a twin spar to which front and rear ribs are jointed and it is covered by stressed aluminium alloy skin. The trim tab completes the assy.

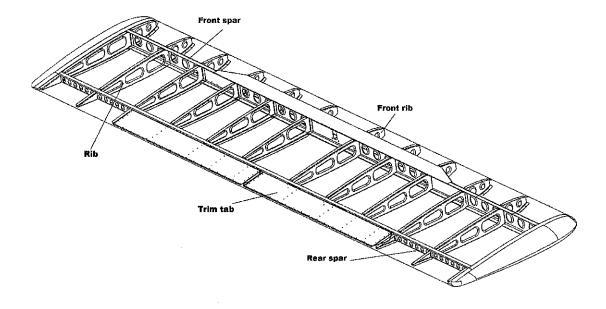

Figure 4. - Stabilator structure

2.4. FLIGHT CONTROLS

The main flight control system controls the airplane in three axes. All primary controls (ailerons, rudder and stabilator) are manually operated by a conventional control column and rudder pedals, pulleys, cables, bellcranks and rods.

The secondary flight controls consist of a two-axis trim system and a flaps system.

Complete dual controls are provided for pilot and co-pilot.

Longitudinal control acts through a system of push-pull rods connected to the control column and moving the stabilator whose anti-tab winglet works also as trim tab. Autopilot pitch servo (if installed) is connected to the push-pull rods system through driving cables.

Longitudinal trim is performed by a small tab positioned on the stabilator and manually operated via a control wheel positioned between the two crew seats. As optional, it is available an electrically operated longitudinal trim which it is also controlled by the autopilot system, when installed.

Trim position is monitored by an indicator on the instrument panel. A trim disconnect toggle switch is provided.

Ailerons control is of mixed type with push-rods and cables; a cable control circuit is confined within the cabin and it is connected to a pair of push-pull rod systems positioned in each main wing which control ailerons differentially.

The U-shaped control wheels, hinged on the top of the control column, control the ailerons. Control wheel motion is transferred to the ailerons through a cable loop, up to the interconnecting rod linking the two push-pull rod systems which finally transmit the motion to the ailerons.

When either aileron control wheel is rotated, the crossover cable rotates the other control wheel.

The left aileron has a trim tab adjustable on ground: its deflection allows for lateral trimming of the airplane.

Both flaps are extended via a single electric actuator controlled by a switch on the instrument panel. Flaps act in continuous mode; the analogue indicator displays three markings related to 0°, takeoff (T/O) and landing (FULL) positions.

An aural warning is generated whenever the flaps are lowered to the FULL position and the landing gear is not down-locked.

Rudder is operated through a cable system. A rudder trim tab allows aircraft directional trimming, especially in case of OEI operation: it is electrically operated via a switch located on the central console placed between crew seats.

Its position is monitored by an indicator on the instrument panel. A trim disconnect toggle switch is provided.

3. POWERPLANT

P2006T is equipped with two four-cylinder four-stroke Rotax 912S engines of 98hp (73kW) each, both rotating clockwise. These are partially liquid cooled and they feature an integrated reduction gear driving constant speed propellers with pitch feathering devices.

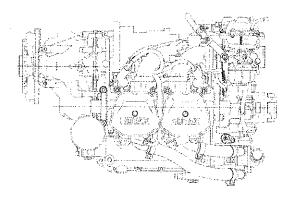

Figure 5. - Rotax 912S

Cooling system is designed for liquid cooling of the cylinders heads and ram-air cooling of the cylinders. The liquid system is a closed circuit with an overflow bottle and an expansion tank.

The coolant flow is forced by a water pump, driven from the camshaft, from the radiator to the cylinder heads. From the top of the cylinder heads the coolant passes on to the expansion tank (item 1, Figure below). Since the standard location of the radiator (2) is below engine level, the expansion tank, located on top of the engine, allows for coolant expansion.

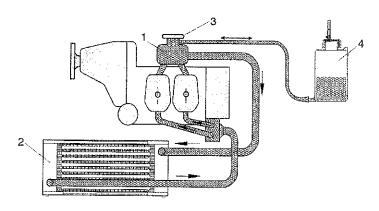

Figure 6. - Liquid cooling system schematic

The expansion tank is closed by a pressure cap (3) fitted with pressure relief valve and return valve. At temperature rise and expansion of the coolant, the pressure relief valve opens and the coolant will flow via a hose at atmospheric pressure to the transparent overflow bottle (4). Once cooled down, the coolant will be sucked back into the cooling circuit.

The engine is provided with a dry sump forced lubrication system with an oil pump with integrated pressure regulator. A thermostatic valve regulates the oil flow to the heat exchanger (oil radiator) on the basis of oil temperature: this allows the engine starting in cold conditions.

The oil tank is installed behind the firewall protected from heat sources. Some holes on the bracket structure allow for air ventilation

The reservoir is fitted with a dipstick; a hose, immediately located beneath the filler cap, allows for oil relief discharged in a safe zone in the cowling, far from exhausts and other heat sources.

Following powerplant instruments are provided:

- LH and RH RPM Indicator
- > LH and RH Manifold Pressure Indicator
- > LH and RH Oil Pressure Indicator
- > LH and RH Oil Temperature Indicator
- > LH and RH Cylinder Head Temperature Indicator

3.1. **ENGINE FEATURES**

Manufacturer	Bombardier-Rotax GmbH	
Model	912 S3	
Certification basis	FAR 33, Amendment 15	
Type Certificate	EASA TCDS no. E.121 dated 1st April 2008	
Engine type	4 cylinders horizontally opposed with 1352 c.c. of overall displacement, liquid cooled cylinder heads, ram-air cooled cylinders, two carburetors, integrated reduction gear box with shock absorber.	
Maximum power	73.5 kW (98.6hp) @ 5800 rpm -5 min. maximum	
(at declared rpm)	69.0 kW (92.5hp) @ 5500 rpm (continuous)	

PROPELLER FEATURES

Manufacturer	MT Propeller
Type certificate	LBA 32.130/086 (MTV-21 series)
Model	MTV-21-A-C-F/CF178-05
Blades/hub	2 wood/composite blades, aluminium hub
Diameter	1780 mm (no reduction allowed)
Type	Variable pitch hydraulically controlled

3.3. **PROPELLER GOVERNOR FEATURES**

Manufacturer	MT Propeller
Model	P-875-12
Туре	Hydraulic

4. PEDESTAL CONTROLS

Following picture shows the controls installed on the central pedestal.

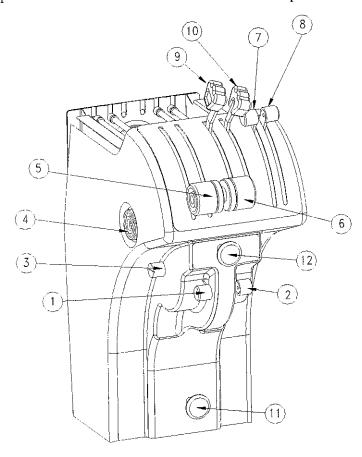

Figure 7. - Pedestal controls

No	Description
1 and 2	Choke control
3	Choke friction knob
4	Upper levers friction knob
5-6	LH and RH Throttle lever
7-8	LH and RH Carburetor Heating lever
9-10	LH and RH Propeller Pitch Control lever
11	Parking brake
12	Windshield defrost control knob

Aircraft not embodying the Design Change 2006/66 "New Powerplant control setting layout" or the SB 039-CS "P2006T New powerplant controls layout" feature a different pedestal levers layout: propeller and carb. heat levers position are inverted.

It is possible to adjust the throttle, propeller and carburettor heat levers friction by appropriately tightening the friction knob located on the central console.

A similar device is provided for engine choke controls.

Carburettor heat control knobs are located between throttle and propellers levers; when the knobs are fully pulled backwards, carburettors receive maximum hot air.

During normal operations, the knobs are fully forward set (carburettors heating set to OFF).

The console houses also the parking brake and windshield defrost control knobs.

5. CABIN OVER-HEAD PANEL CONTROLS

Following picture shows the controls installed on the cabin over-head panel.

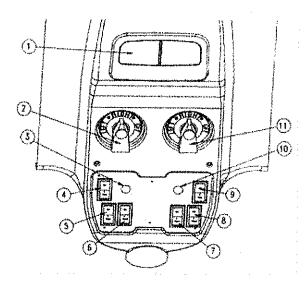

Figure 8. - Cabin head panel controls

No	Description

6	LH Engine ignition 2
7	RH Engine ignition 1
8	RH Engine ignition 2
9	RH electric fuel pump
10	RH Electric Starter
11	RH Fuel selector valve

6. INTERNAL LIGHTS

Internal lights system is composed by following equipment:

- · Cabin light, providing lighting for crew and passengers compartment;
- Instruments lights, which in turn are composed by three sub-systems each one fitted with dimming device:
 - > Switches built-in lights
 - Avionics lights
 - Cockpit lights
- Emergency light

The **cabin light** is a ceiling light, fitted with control switches, located on the overhead panel in correspondence of the crew seats.

About the **instrument lights** (controlled by a switch on the RH instrument panel), the switches built-in lights concern the instrument panels switches lighting, the avionics lights concern the avionic equipment lighting and the cockpit lights concern two lights located on the over-head panel illuminating LH and RH instrument panels (see Figure below).

All above mentioned lights are supplied by the battery bus apart from the **Emergency light** which is directly connected to the battery. It is a five-leds light located in the over-head panel (see Figure below) controlled by a switch installed on the LH breakers rack.

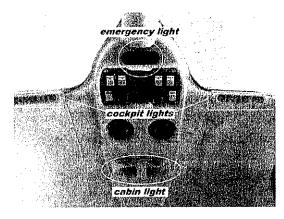

Figure 9. - Over-head panel lights arrangement

7. EXTERNAL LIGHTS

External lights system consists of the following equipment (see Figure below):

- NAV Lights: they provide, by means of three position lights, the aircraft flight direction identification.
- **Strobe Lights**: they provide aircraft identification to prevent collision. They are located, like the above mentioned NAV lights, on the winglets and on the top of the vertical fin.
- Taxi Light: supports taxi maneuvering on the ground at night. It is installed on the left wing leading edge.
- Landing Light: provides ground reference information during final approach, touchdown, ground roll and take off and illuminates any major obstructions in the airplane approach glide path or on runway at night. It is installed on the left wing leading edge.

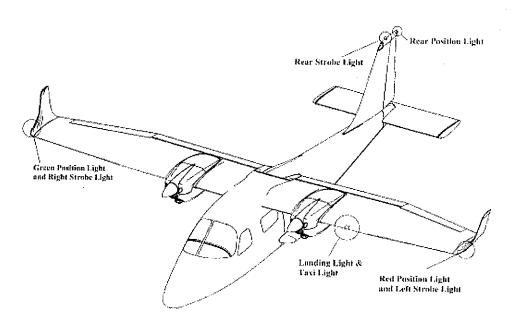

Figure 10. - External lights arrangement

All mentioned lights, whose circuits are protected by dedicated breakers, are activated by the related switches on the right instrument panel: see below.

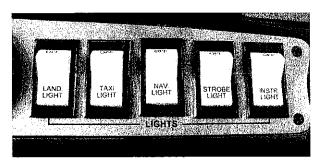

Figure 11. - Lights switches panel

8. FUEL SYSTEM

Fuel system consists of two integrated tanks inside the wing torque boxes and fitted with inspection doors.

Each fuel tank has a capacity of 100 litres and is equipped with a vent valve (its outlet is located on the lower wing skin) and a sump fitted with a drain valve for water/moisture drainage purposes.

An electric fuel pump feeds the pertinent engine in case of engine-driven pump failure. The fuel Gascolator (a sediment-filter bowl) is located beneath the engine nacelle, between the fuel tank and the electrical pump, in correspondence of the fuel system lowest point. It is fitted with a drain valve which allows for the overall fuel line drainage.

Fuel quantity indicators and fuel pressure indicators for each engine are located on the RH instrument panel.

In normal conditions, to supply fuel to engines, each engine pump sucks fuel from the related tank; crossfeed is allowed by fuel valves located on the front spar and controlled by Bowden cables from the fuel selectors located on the cabin overhead panel.

Left fuel selector manages the left engine feeding, allowing fuel supply from the left fuel tank or from the right one (crossfeed).

Right fuel selector manages the right engine feeding, allowing fuel supply from the right fuel tank or from the left one (crossfeed).

Each selector can be set in OFF position only pulling and simultaneously rotating the lever: this avoids an unintentional operation.

Use of Aviation Fuel Avgas 100LL results in greater wear of valve seats and greater combustion deposits inside cylinders due to higher lead content. Make reference to Rotax Maintenance Manual who provides dedicated checks due to the prolonged use of Avgas.

System schematic is shown on the following Figure.

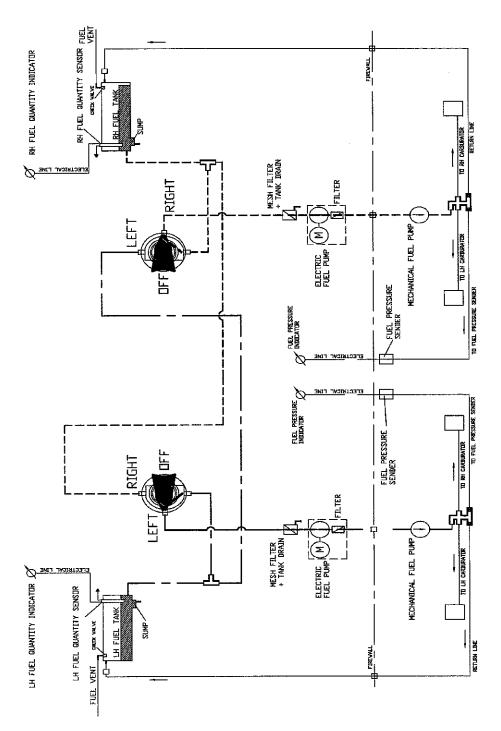

Figure 12. - Fuel system schematic

9. LANDING GEAR SYSTEM

The landing gear retraction system is of electro-hydraulic type, powered by a reversible pump which is electrically controlled by the LG control knob located on the LH instrument panel and by the legs position micro switches: these ones allow for detecting landing gear "down-locked" and "up" positions and for alerting the pilot by aural means should the approach and landing configuration be incorrect, in terms of flaps/throttle levers/landing gear position, in order to avoid an unintentional gear-up landing.

The system operates in two modes: normal and emergency.

Normal operation provides gear extension and retraction by means of hydraulic jacks. Gears extension is helped by gravity also.

Emergency operation only provides landing gear extension by means of a hydraulic accumulator which discharges pressurized oil in the above mentioned jacks.

HYDRAULIC SCHEMATIC DIAGRAM

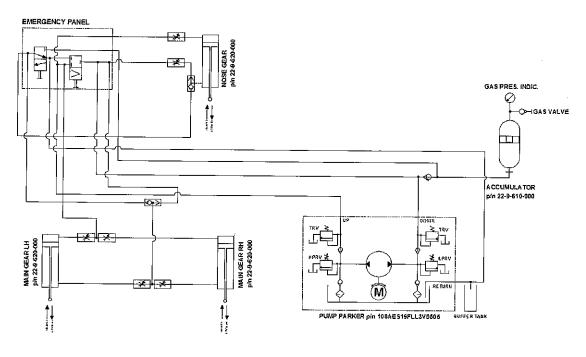

Figure 13. LG hydraulic system schematic

4th Edition, Rev 0

Hydraulic oil, contained in an integrated reservoir located inside the Hydraulic Power Pack, is pressurized by a reversible electric pump: as the LG control knob is placed in either the UP or DOWN position, the pump directs the fluid through the related pressure line toward each hydraulic jack.

In order to prevent an inadvertent LG retraction, the control knob must be pulled before being pushed upward for UP command.

The emergency hydraulic accumulator is used for the landing gear extension: normal extension line and emergency extension line converge in correspondence of the shuttle valves (two valves: the first one for NLG and the second one for MLG emergency operation).

The emergency accumulator nitrogen pressure indicator is located on the tail cone, left side; on ground, a red push-button located beneath the pressure indicator allows the electrical pump for charging the accumulator should the nitrogen pressure be below the lower limit indicated on the placard.

Emergency extension is controlled by two distributors located on the cabin floor, under a removable cover in correspondence of the pilot seat.

The LG indication system is electrical and it is composed by the following main components:

- ➤ UP/DN limit micro-switches
- > leg position lights, 3 green
- > transition light, 1 red
- > pump light, 1 amber
- > push to test (if installed)

(6 couples, 2 for each leg)

(turned ON when the pertinent leg is extended and locked and located on the LH instrument panel)

(turned ON during transition phases)

(GEAR PUMP ON caution amber light turned ON when the pump is electrically supplied)

when the pump is electrically supplied)

(for landing gear red and green lights operational check)

The three green lights illuminate only when the respective gear is "down-locked"; the red light indicates the gear is in transit "up" or "down" and the amber caution light GEAR PUMP ON indicates that the pump is electrically supplied.

The red transition light extinguishes only when all the three gear legs are "downlocked" or they are "up" while the amber caution light extinguishes only when the electrical pump is "off".

The Up/Down limit switches control the LG lights lighting and pump operation on the basis of LG configuration set by the pilot through the LG control knob.

A "push to test" button is used to check that the landing gear position lights are operating.

A warning horn alerts the pilot when the LG control knob is in UP position and at least one of the two throttle levers and/or flaps are respectively set to idle and to LAND position.

During emergency extension, LG position lights work as per normal extension mode: for this reason the LG control knob must be set on DOWN position before starting the emergency procedure.

IMPORTANT

After each emergency landing gear extension, apply the restoration procedure described in the AMM.

10. BRAKES

The A/C is provided with an independent hydraulically actuated brake system for each main wheel. A master cylinder is attached to each pilot/co-pilot's rudder pedal: see schematic below.

Hydraulic pressure, applied via the master cylinders, enters the brake via lines connected to an inlet fitting on the wheel brake caliper.

A parking brake valve, mounted in correspondence of the cabin floor and operated by a knob on the cockpit central pedestal, intercepts the hydraulic lines, once the system is pressurized, to hold the brake assemblies linings tightened round the main wheels brake discs.

Brakes can be operated from both pilot's and co-pilot's pedals: a single vented oil reservoir feeds the pilot side master cylinders which are connected, via hoses, with the co-pilot's side ones.

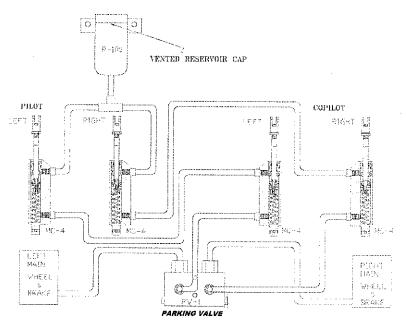

Figure 14. Brake system schematic

On the ground, when a pedal is pushed to steer the airplane, do not operate the opposite toe brake until the pedals are back aligned again. This prevents pedals mechanism from being damaged.

11. VENTILATION

If required, pilot allows for ram-air entering the cabin via the two outlet ports respectively located on the left and right side of the instruments panel. Other two ram-air ventilation outlets are located on the cabin head, in the passengers' zone.

For aircraft embodying MOD2006/208 a fan is installed in order to convoy air into the cabin during on ground operations at low speeds, namely, when air inlets are ineffective. By means of a lever switch is possible to turn ON the Cabin Fan. The Fan is connected to the RH Alternator Bus by means of a circuit breaker labelled as "Cabin Fan".

During flight operations, air comes from outside of the aircraft through air inlets and in this case the valve installed inside the hoses prevents air from fan from entering inside the cabin.

12. CABIN HEAT

The cabin heating system utilizes hot air coming from engines heat exchangers: here cold ram-air is warmed by engine exhaust gases and then it is routed to the heating system hoses.

The cabin heat control knobs are positioned on the lower side of the LH instrument panel; when knobs are fully pulled, cabin receives maximum hot air.

Left knob controls the warm air from LH engine heat exchanger, right knob controls the warm air from RH engine heat exchanger.

Crew heating system outlet ports are located on the cabin floor, near the pedestal; for passengers zone it is provided an outlet port on the cabin head.

Windshield defrost is operated via a knob positioned on the pedestal: when knob is pulled the hot air flow for crew heating is deviated to the windshield.

13. SEATS AND SAFETY BELTS

In correspondence of the seats, three fitting points safety belts are provided; belt adjustment is via the sliding buckle located on the belt metal hook.

Seats are built with light alloy tube structure and synthetic material cushioning. It is possible to perform following seat adjustments:

Horizontal – pulling the lower front lever and sliding the seat

Vertical – operating the lever located on the outward seat side

Seat back inclination – unlocking it via the lateral knob

These adjustments ensure the crew and passengers comfort.

14. DOORS

The cabin main door is located forward, on the left side of the fuselage while the emergency exit (passenger door) is located aft, on the right side of the fuselage.

On the top of the cabin it is located the ditching emergency exit: see figure below.

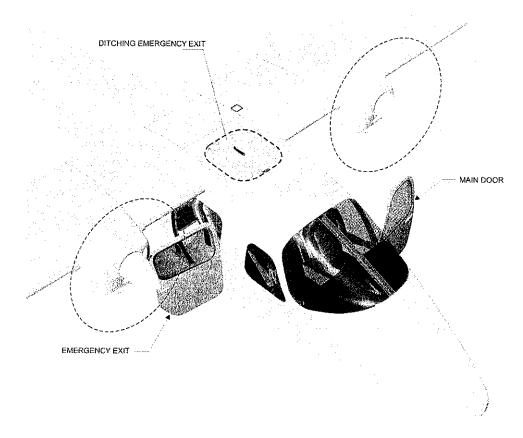

Figure 15. Doors location

Being the main door located in correspondence of the propeller disc, its operation is limited to the engine shut-down condition.

In fact, in order to prevent crew injuries, an electro-mechanical device locks the door latch when left engine runs. A pressure switch senses engine oil pressure and allows for electrical supply to a solenoid which engages the door lock mechanism.

This prevents the latch opening when left engine runs but, if needed, the device can be also manually by-passed operating either from the door inside panel or

from outside. Instructions are reported on the placards near the by-pass lever, located in correspondence of the latch: to unlock it is necessary to push and hold the red tab down, after that the door can be opened operating the handle.

After engine shut-down, the pressure drop can have a certain delay, preventing the door from being opened by normal means: do not force the handle but operate the override system above mentioned.

In any case, the electric lock becomes disengaged after a complete loss of the electric power.

Two switches engage respectively when the door and the latch are closed. Should one or both switches be released, the MAIN DOOR OPEN warning light is turned ON.

The emergency exit is fitted with the same safety device: in this case the pressure switch allowing for solenoid operation is activated from right engine oil pressure line; should be the door "open" or "closed and unlocked", the REAR DOOR OPEN warning light is turned ON.

Any voluntary operation of the manual by-pass solenoid lock causes related door warning light is turned on.

The ditching emergency exit is manually operated turning the handle and pushing outward the door.

The yellow fluorescent painted handle, which can be operated also from outside, is fitted with a safety wire assuring removal effortlessness. When the door is open, it stays connected to the fuselage by means of two cables which allow for door opening forward.

15. BAGGAGE COMPARTMENT

The baggage compartment is located behind the passengers' seats. The baggage must be uniformly distributed on the floor and the weight cannot overcome 80kg. Make sure that the baggage is secured before the flight.

16. PLACARDS

In addition to the limitation placards reported on Section 2, following placards are installed on the aircraft.

Additionally, nearby the placards listed below (English language), directly-translated placards in the language of the country in which the airplane is registered can be installed, when required by the specific NAA.

Description	Placard	Place
ELT equipment location	ELT	Baggage compartment, right side

18. ELECTRICAL SYSTEM

Primary DC power is provided by two engine-driven generators which, during normal operations, operate in parallel.

Each generator is rated at 14,2-14,8 Vdc, 40 Amp, and it is fitted with an integrated regulator, which acts to maintain a constant output voltage, and with an automatic overvoltage device protecting the circuits and the electric components from an excessive voltage caused by generator failures.

The power rating of the each generator is such that if one generator fails the other one can still supply the airplane equipment to maintain flight safety.

Secondary DC power is provided by a battery (lead type - Gill Teledyne G35, 12 V, 38-Ah in 20h run time) and an external DC power source can be connected to the aircraft DC distribution system.

On the instruments panel, right side, it is installed a voltmeter/ammeter. The ammeter section can indicate the current supplied by either left or right generator switching a dedicated selector.

There are five different busses (make reference to Figure 11):

- · Battery bus
- LH Generator bus
- RH Generator bus
- LH Avionic bus
- RH Avionic bus

The distribution system operates as a single bus with power being supplied by the battery and both generators but it is possible to separate the left busses from the right busses when required by means of the Cross Bus switches.

All electrical loads are divided among the five busses on the basis of their importance and required power: equipment with duplicate functions are connected to separate busses.

The Battery bus, which supplies the most important loads, is energized from three sources: the battery and both generators. This allows the bus for remaining active also in case of two independent faults in the supply paths.

The following loads are connected to the battery bus:

Battery Bus		
Audio Panel		
VHF COMM 1		
NAV 1		
GPS		
LH and RH Fuel electrical pump		
LH and RH Fuel pressure		
LH and RH Fuel quantity		
LH and RH oil pressure		
LH and RH oil temperature		
LH and RH CHT		
LH and RH RPM indicator		
LH Attitude indicator		
Cabin lights		
Cockpit lights		
Switches built-in lights		
Avionics lights		
Annunciator Panel		
Strobe lights		
Flaps		
Doors pressure switches		
Engine hour meter (2 units)		
OAT		
Turn coordinator		
LG hydraulic pump		
LG indicating & control system		
LH and RH Fire detector		
12V cabin electrical power sockets (2 units)		

In addition, directly on the battery, the following devices are connected:

- Emergency back-up attitude indicator (RH attitude indicator usually supplied from RH generator bus), when installed;
- Emergency Light
- Chronometer

The first two devices are controlled by the pertinent switches located on the LH breakers rack.

The other loads are so divided among following busses:

LH GEN Bus	LH Avionic Bus
Pitot heat	DME
Landing light	Transponder
Taxi light	Encoder altimeter

RH GEN Bus	RH Avionic Bus
NAV lights	ADF
Rudder trim	COM 2
Stall warning	NAV 2
RH attitude indicator	A/P (*)
	A/P Pitch Trim (*)

(*) if installed

On the central pedestal (see Figure below) there are seven switches disposed on two rows: on the first row there is the MASTER SWITCH which allows for connecting, through the battery relay, the battery to the battery bus.

LH and RH FIELD switches control the pertinent generator: setting the switch to OFF puts the pertinent generator off-line.

In correspondence of the second row there are 4 switches LH/RH AVIONIC and LH/RH CROSS BUS.

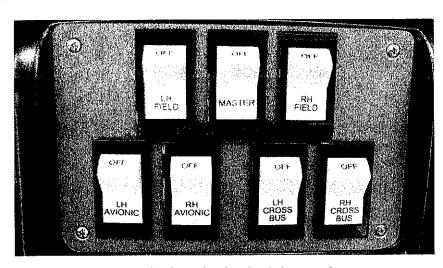

Figure 21. Central pedestal switches console

The first two allow, through a relay, for cutting off the power supply to the pertinent avionic bus.

The second ones allow, through a relay, for realizing the parallel connection between the pertinent generator bus and the battery bus. Setting these ones to OFF,

the pertinent generator bus (and related avionic bus supplied) is separated from the battery bus and from opposite generator bus.

When both generators are correctly operating and all above mentioned switches are in ON position, all the busses are connected to the generators.

The ignition switches, two for each engine and grouped on the over head panel, are instead independent from the airplane electrical system (generation and distribution); they only control and open the engine electrical circuit

If ignition switches are turned ON, a propeller movement can cause the engine starting with consequent hazard for people nearby.

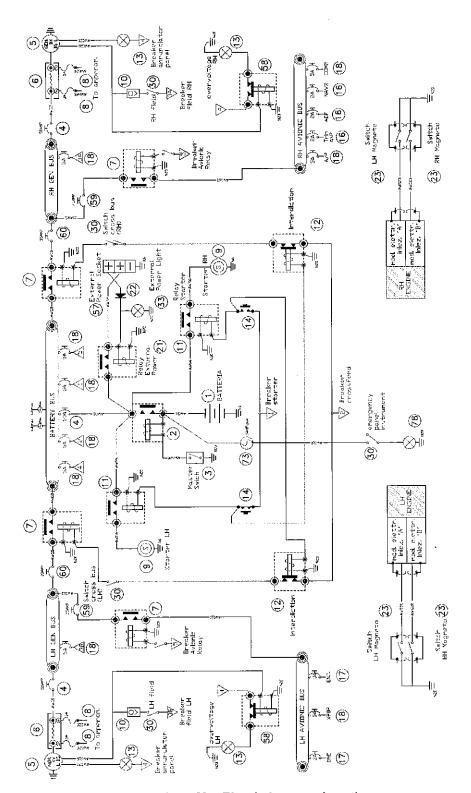

Figure 22. – Electrical system schematic

INTRODUCTION

This section contains supplemental information to operate, in a safe and efficient manner, the aircraft when equipped with S-TEC Fifty Five X autopilot device.

GENERAL

The System Fifty Five X is a rate based autopilot. When in control of the roll axis, the autopilot senses turn rate, as well as closure rate to the selected course, along with the non-rate quantities of heading error, course error and course deviation indication.

When in control of the pitch axis, the autopilot senses vertical speed, acceleration, and closure rate to the selected glideslope, along with the non-rate quantities of altitude and glideslope deviation indication.

These sensed data provide feedback to the autopilot, which processes them in order to control the aircraft through the use of mechanisms coupled to the control system.

The "autotrim" function senses when the aircraft needs to be trimmed about the pitch axis, and responds by driving the trim servo in the proper direction to provide trim.

LIMITATIONS (EASA APPROVED)

The S-TEC "Pilot's Operating Handbook Fifty Five X" (4th Edition – First Revision dated March 01, 2008 or a more updated version) must be carried in the aircraft and made available to the pilot at all time.

In accordance with FAA recommendation (AC 00-24B), use of basic "Altitude Hold" mode is not recommended during operation in severe turbulence.

Following operating limitations shall apply when the aircraft is equipped with S-TEC Fifty Five X autopilot:

- 1. The Autopilot is certified for Category I ILS Approaches [with a decision height not lower than 200 feet AGL (61m)]
- 2. Autopilot operation forbidden with flaps extended more than TO position
- 3. During Autopilot operation, a pilot with seat belt fastened must be seated at the left pilot position
- 4. The use of Autopilot during single engine operation is forbidden
- 5. Autopilot DISC during take-off and landing
- 6. Maximum speed for Autopilot operation is 135 KIAS
- 7. Minimum speed for Autopilot operation is 85 KIAS
- 8. Minimum altitude AGL for Autopilot operation is:
 - a. Cruise and Descent: 1000 ft
 - b. Climb after takeoff and not precision approach: 400 ft
 - c. ILS CAT I precision approach: 200 ft

On the instrument panel, in clear view of the pilot, it is placed the following placard reminding the observance of aircraft operating limitations during Autopilot operation:

OPERATING LIMITATIONS FOR AUTOPILOT S-TEC 55X

- · Category I ILS Approaches only (200 ft AGL)
- · Do not use AP during take-off and landing
- · Do not use AP with flaps extended more than TO position · AP operanting speeds range: 85 to 135 KIAS
- · Pilot with seat belt fastened must be seated at the left pilot position during AP operation
- · Min. altitude AGL for Autopilot operation is: Cruise and Descent: 1000 ft
- Do not use AP during single engine operation
- Climb after takeoff and not precision approach: 400 ft

EMERGENCY PROCEDURES

In event of autopilot malfunction, or when the system is not performing as expected or commanded, take immediately the aircraft control disconnecting the autopilot which must be set inoperative until the failure has been identified and corrected.

Altitude lost during a pitch axis autopilot malfunction and recovery

Following table addresses the altitude lost during a pitch axis malfunction and recovery for each reported flight phase:

Flight phase	Altitude loss
Climb	200 ft
Cruise	150 ft
Descent	200 ft
Manoeuvring	50 ft
Approach	80 ft

Autopilot hardover or failure to hold the selected heading

In case of Autopilot hardover or failure to hold the selected heading, apply following procedure:

Accomplish items 1 and 2 simultaneously:

1. Airplane control wheel

GRASP FIRMLY and OVERPOWER if

necessary to regain aircraft control

2. AP DISC/TRIM INTR switch

PRESS

3. AP MASTER SWITCH

OFF

4. AP Circuit Breaker

PULL

When Autopilot is disconnected as a consequence of a malfunction, hold the control wheel firmly: it may be necessary up to 35 pounds (15.8 daN) of force on the control wheel to hold the airplane level.

When Autopilot is disconnected, it may be necessary operate the pitch trim through either the Manual Electric Trim Switch or the Trim Wheel.

Electric trim malfunction

In case of Electric Trim malfunction (either in AP Autotrim mode or when manually operated through the Manual Electric Trim Switch), apply following procedure:

1. AP DISC/TRIM INTR switch

PRESS and HOLD

2. TRIM MASTER SWITCH

OFF

3. TRIM Circuit Breaker

PULL

4. AP DISC/TRIM INTR switch

RELEASE

When Autopilot is disconnected because of a pitch trim malfunction, hold the control wheel firmly: it could be necessary up to 35 pounds (15.8 daN) of force on the control wheel to hold the airplane level.

When electric trim is disconnected, it may be necessary operate the pitch trim through the Trim Wheel.

When electric trim is disconnected, Autopilot system can be operated both in pitch and roll modes; nevertheless, when a pitch mode (ALT HOLD, VS, GS) is engaged, the Autopilot will provide an annunciation whenever it is necessary to manually trim the aircraft about the pitch axis using the Trim Wheel. Make reference to S-TEC "Pilot's Operating Handbook Fifty Five X" (4th Edition – First Revision dated March 01, 2008 or a more updated version).

GYRO DIRECTIONAL SIGNAL LOST

When AP is engaged and the gyro directional electrical supply is lost (instrument warning flag displayed), an aural warning alerts the pilot to the failure; in this case the AP must be disconnected applying following procedure:

Accomplish items 1 and 2 simultaneously:

1. Airplane control wheel

GRASP FIRMLY and OVERPOWER if

necessary to regain aircraft control

2. AP DISC/TRIM INTR switch

PRESS

3. AP MASTER SWITCH

OFF

4. AP Circuit Breaker

PULL

5. Refer to other navigation means for heading information

When Autopilot is disconnected as a consequence of a malfunction, hold the control wheel firmly: it may be necessary up to 35 pounds (15.8 daN) of force on the control wheel to hold the airplane level.

When Autopilot is disconnected, it may be necessary operate the pitch trim through either the Manual Electric Trim Switch or the Trim Wheel.

NORMAL OPERATIONS

Normal operating procedures, including pre-flight checks, are described on S-TEC "Pilot's Operating Handbook Fifty Five X" (4th Edition – First Revision dated March 01, 2008 or a more updated version).

The vertical speed mode is used to establish and hold a PILOT selected vertical speed. Since the autopilot receives no airspeed information, it is the responsibility of the pilot to ensure that the vertical speed selection is within the operating limits of the aircraft's capabilities. Selection of a vertical speed beyond the capability of the aircraft can create a condition of reduced airspeed, and possibly lead to a stall condition.

PERFORMANCES

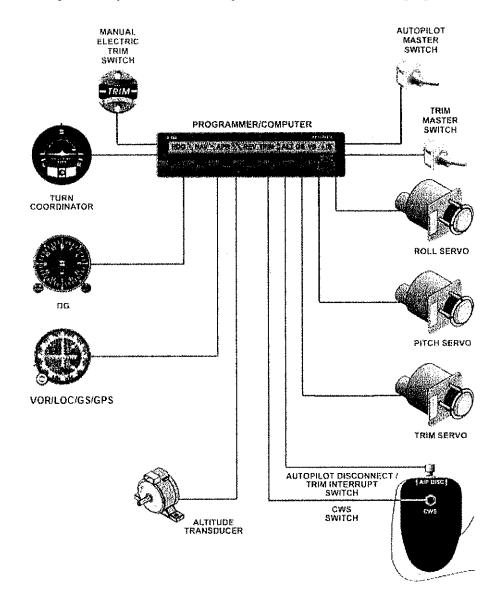

S-TEC Fifty Five X Autopilot employment does not affect the aircraft performances.

WEIGHT AND BALANCE

See Section 6 of this Manual.

SYSTEMS

The System Fifty Five X Block Diagram is shown in the following figure.

SUPPLEMENT NO. A13-B - GARMIN GTN-650/750 GPS/WAAS COMM/NAV

INTRODUCTION

This section contains supplemental information to operate, in a safe and efficient manner, the aircraft when equipped with Garmin COMM/NAV/GPS unit.

GENERAL

- 1. GTN 650/750 is an integrated unit with touchscreen interface that contains a GPS navigation system in addition to a VHF COMM radio transceiver and a VOR/ILS receiver.
- 2. The system consists of a GPS/WAAS antenna, a VOR/ILS antenna and a VHF COMM antenna.
- 3. The main function of the VHF Comm is to allow communication with the control tower.
- 4. The VOR/ILS section function is to receive and to demodulate VOR/LOC/GS signals.
- The GPS section function is to acquire the GPS satellite signal and to supply in real time the information of position, speed and time.

The GTN 650 front panel is shown in the figure below.

The GTN 750 front panel is shown in the figure below.

LIMITATIONS (EASA APPROVED)

- 1. The GARMIN GTN 650/750 Pilot's Guide and Reference p/n 190-01004-03 rev. E / p/n 190-01007-03 Rev. B, or a more updated version, must be available on board for the correct device use.
- 2. The system employment is allowed in IFR flight conditions.

Main subsystem software version is indicated for 5 seconds immediately after the GTN 650/750 system has been turned on. Other subsystems software versions can be verified on the SYSTEM PAGE, "SYSTEM STATUS".

3. The unit settings can be changed on the SYSTEM PAGE, "UNITS".

EMERGENCY PROCEDURES

- 1. Should the Garmin GTN 650/750 information be unavailable or manifestly wrong, it is necessary to use other navigation instruments.
- 2. If during navigation (only in ENROUTE mode) GPS signal is lost, the instrument continues to operate in DR (Dead Reckoning) mode. Aircraft position is estimated on the basis of the last GPS valid signal, but it can be significantly distorted by relative speed variations. On the lower left side of the maps the advice "DR" appears.
- 3. If during a GPS precision approach the vertical limits are overcome, the Vertical Guide is signalled as unavailable. The procedure must be carried out exclusively using the LNAV function.
- 4. During a GPS approach where the precision/no-precision overcoming limits warning come up, an "ABORT APPROACH" advice appears on the screen. GPS can be used to perform the abortive approach manoeuvre; also other approved instruments/devices shall be used.
- 5. In case of emergency flight conditions, press and hold volume knob or the external remote COM flip-flop key for two seconds, in order to set automatically the receiver on the emergency frequency: 121.500MHz.

NORMAL OPERATIONS

DETAILED OPERATING PROCEDURES

Normal operations procedures are reported on the GARMIN GTN 650/750 Pilot's Guide and Reference p/n 190-01004-03 rev. E / 190-01007-03 Rev. B or later.

GARMIN GTN 650 Pilot's Guide and Reference p/n 190-01004-03 rev. E / 190-01007-03 Rev. B or later - must be carried onboard the airplane at all times.

PERFORMANCES

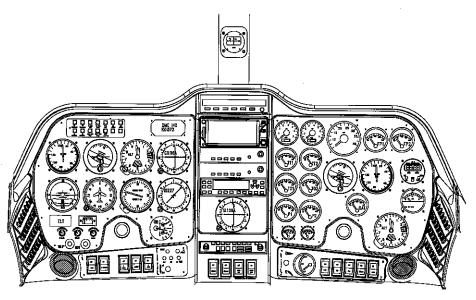

The Garmin GTN-650/750 employment does not affect the aircraft performances.

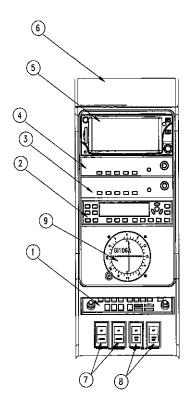

WEIGHT AND BALANCE

INTRODUCTION

This section contains information to operate the airplane equipped with a supplemental battery dedicated to engines starting.

GENERAL

The engine starting battery is housed in a dedicated box under the main battery box: both batteries are accessible through the inspection cap F10 on the left side of the tail cone.

LIMITATIONS

See Section 2 of this Manual.

EMERGENCY PROCEDURES

In event of the following failure conditions, addressed on Section 3 of this Manual and leading to fly without power generation system:

- Both generators failure (Para. 3.1)
- Both generators overvoltage (Para 3.3)

apply, at the end of related checklist, following procedure:

EMERG BATT switch

ON

NORMAL OPERATIONS

During Cockpit Inspections (see Para. 3.2 – Section 4 of this Manual), perform also following check:

Eng. Starting Battery Voltmeter

CHECK 12 to 14 Volt

PERFORMANCES

See Section 5 of this Manual.

WEIGHT AND BALANCE

For weight and balance, make reference to Section 6 of this Manual; additionally, the equipment list reported on Para. 5 is so integrated:

	EQUIPMENT LIST	AIRCRAFT S/N_	DATE	.		
Ref.	DESCRIPTION	P/N	Inst	Weigнт [kg]	ARM [M]	
AVIONICS & MISCELLANEOUS						
A14-1	Engine Starting Battery (EnerSys SBS8)		X	2.7	3.7	

SYSTEMS

When airplane embodies the design change in subject, in addition to the main battery, a dedicated engine starting battery is introduced.

The entire primary loads stand connected to the main battery itself and the engine starting battery is recharged by the LH generator.

This modification is transparent to the crew because it does not change deeply the usual normal and emergency procedures.

Additionally, in event of the overall loss of power generation, the starting battery can be put in parallel with the main battery by means of the EMERG BATT switch activation.

In order to allow the charging status check of the battery, a voltmeter is provided. Pushing the button close to the voltmeter, crew can read the battery status.

Both batteries are accessible through the inspection cap F10 on the left side of the tail cone.

When the design change in subject is embodied, following placards are installed on the airplane:

Description	Placard	Place
Engine starting battery voltmeter location	Eng. Starting Battery Voltmeter	Close to the voltmeter
Batteries compartment location	OPEN HERE 1/4 TURN BATTERIES INSIDE	Fuselage tail cone, left side

INTRODUCTION

This section contains supplemental information to operate, in a safe and efficient manner, the aircraft when equipped with Garmin GMA345 device.

Bluetooth Annunciator USB Jack Type A

GENERAL

Garmin GMA345 is the audio management device used on P2006T.

The audio panel handles internal audio communications (INTERCOM), external audio communications (allowing COM1 to COM2 switching), those related to the markers during ILS approaches and, eventually, those related to the on board music entertainment.

LIMITATIONS

Garmin GMA345manuals do not address operating limitations more severe than those usually applicable to the P2006T.

EMERGENCY PROCEDURES

No particular emergency procedures, related to the GMA345 audio panel employment, are applicable.

In case of internal electrical failures or in case of loss of electrical supply, Garmin GMA 345 automatically switches on COM1 selected frequency to allow the pilot for handling radio communications.

NORMAL OPERATIONS

DETAILED OPERATING PROCEDURES

Normal operating procedures are described on "GARMIN GMA 345 Pilot's guide" (P/N 190-01878-01) rev. C or later versions.

GARMIN GMA 345 Pilot's guide" (P/N 190-01878-01) - rev. C or later versions - must be carried onboard the airplane at

PERFORMANCES

Garmin GMA345 audio panel employment does not affect the aircraft performances.

WEIGHT AND BALANCE

See Section 6 of this Manual.

SYSTEMS

Refer to "GARMIN GMA 345 Pilot's guide" (P/N 190-01878-01) rev. C or later versions for a complete system description.

INTRODUCTION

This section contains supplemental information to operate the aircraft in a safe and efficient manner when equipped with Garmin GTX345R device.

GENERAL

Garmin GTX345R is a transponder operating with A, C and S mode.

LIMITATIONS

Garmin GTX345R manuals do not address operating limitations more severe than those usually applicable to the P2006T.

EMERGENCY PROCEDURES

In case of emergency conditions, transponder is able to send codified messages to the Air Traffic Control; messages are classified as follows:

Code	Condition		
7500	Aircraft subjected to illegal interference		
7600	Loss of radio communications		
7700	Emergencies		

NORMAL OPERATIONS

DETAILED OPERATING PROCEDURES

Normal operating procedures are described on GTX345R Pilot's Guide, P/N 190-01499-00 Rev. F or later.

PERFORMANCES

Garmin GTX345R employment does not affect the aircraft performances

WEIGHT AND BALANCE

See Section 6 of this Manual.

SYSTEMS

GTX 345R is a Mode S transponder with ADS-B extended squitter capability and also includes UAT and 1090 receivers for ADS-B IN (optional)/OUT capabilities. It is mounted on a rack, located behind the PFD.

It delivers up to 250 watts of nominal power. GTX 345R is connected to GTN 650 (NAV/COM/GPS) for visual information.

The GTX 345R is connected to Audio Panel, Encoder and to XPDR antenna.

INTRODUCTION

This section contains supplemental information to operate, in a safe and efficient manner, the aircraft when equipped with Garmin GNC255 COMM/NAV.

GENERAL

Combining a powerful VHF communications transceiver with 200 channel VOR, Localizer and Glideslope receivers, the GNC 255 provides a full functioned navigation and communications solution. Besides traditional NAV/COM features, the GNC 255 also incorporates workload-reducing functions such as automatic decoding of the Morse code station identifier for VOR/LOC, most-used frequency storage in memory, built-in course deviation indicator, and more.

The GNC 255 has the ability to monitor the standby COM frequencies. The GNC 255's COM radio operates in the aviation voice band, from 118.000 to 136.975 MHz, in 25 kHz steps (default). For European operations, configuration for 8.33 kHz steps is provided with the GNC 255A (10 watt) and GNC 255B (16 watt). The GNC 255 VHF NAV receiver operates from 108 MHz to 117.95 MHz decoding both the VHF Omni Range and Localizer navigation signals. The built-in Glideslope receiver will automatically tune the corresponding glideslope paired frequencies (328 MHz to 335 MHz) when the localizer is tuned.

LIMITATIONS

Refer to basic AFM.

EMERGENCY PROCEDURES

Refer to basic AFM.

NORMAL OPERATIONS

DETAILED OPERATING PROCEDURES

Normal operating procedures are described on GARMIN GNC255 Pilot's guide (P/N 190-01182-01).

GARMIN GNC255 Pilot's guide (P/N 190-01182-01) must be carried on board the airplane at all times.

PERFORMANCES

Refer to basic AFM.

WEIGHT AND BALANCE

See Section 6 of this Manual.

AIRFRAME AND SYSTEMS DESCRIPTION

Refer to GARMIN GNC255 Pilot's guide (P/N 190-01182-01) for a complete system description.

AIRCRAFT CARE AND MAINTENANCE

Refer to basic AFM.
